1 INTRODUCTION

1.1 Purpose and Overview

The 7k Data Format Definition document (DFD) defines record types and data formats. This DFD is relevant to the Teledyne RESON 7k series, Teledyne Odom MB2, Teledyne BlueView ProScan software, HydroSweep 3rd generation (HS3) sonars and all other applications and sonars using 7K Data record formats.

The BlueView data format definition is described in a separate chapter.

The 7k DFD also provides record definitions for generic sensors. This provides a robust, highly expandable generic wrapper format for sonar data in general, which includes all auxiliary sensors and information needed to completely describe data logged during a survey.

This record-based protocol encapsulates data using frames and headers. All records have a unique type identifier, and each record is wrapped within a frame that identifies and describes the content of the record.

A record's embedded synchronization pattern, combined with its checksum, is a powerful aid in real time record validation and recovery from file corruption.

The data format also defines conventions pertaining to position, rotation, data types and time for consistent data handling.

For Teledyne RESON sonars the application titled "7k Center" is used to log and transmit network data. The 7k Center is the primary interface to the sonar and provides auxiliary sensor support. It is included as standard software on all production units.

1.2 Terms and Acronyms

The following table contains definitions of terms and acronyms used in this document.

Table 1: Terms and Acronyms

Term	Definition
7k Data Format	A record-based data format defined for data logging and network transmission for use, in part, with the SeaBat™ 7k systems
Altitude	Distance from the seafloor to the sensor
Azimuth	Horizontal angle with respect to true North base line
BITE	Built-In Test Environment
COG	Center of Gravity
Depth	Distance from the sea surface to the sensor
DFD	Data Format Definition (this document)
Heading	True heading
N/A	Not applicable
Pitch	Rotation about the across-ship (X) axis
Roll	Rotation about the along-ship (Y) axis
SeaBat™ 7k	Generic term used to describe the SeaBat™ 7000 series of sonar systems, related software components and protocols
TPE	Total Propagated Error
VRP	Vessel Reference Point
Yaw	Rotation about the vertical (Z) axis

2 CONVENTIONS

2.1 Overview

This section describes the conventions and definitions used within this document.

2.2 Sign Conventions

Unless otherwise stated, all offset measurements shall be relative to the vessel reference point (VRP). Distances shall be in meters, angles in radians, and headings in degrees. The convention used for 3-D coordinate rotation is roll, pitch then yaw. The following sign conventions shall be used:

Table 2: Sign Conventions

Offset	Sign	Description
X	+	Starboard of the VRP
	-	Port of the VRP
Y	+	Forward of the VRP
	-	Astern of the VRP
Z	+	Distance above the VRP
	-	Distance below the VRP ⁴⁴
Roll	+	Port Up
	-	Port Down
Pitch	+	Bow up
	-	Bow down
Yaw	+	Bow to Starboard
	-	Bow to Port
Heave	+	Up
	-	Down
Heading	+	Heading is always positive – from 0 to 359.99° It will never be a negative value
	-	
Altitude	+	Up
	-	Down
Depth	+	Up
	-	Down
Tide	+	High Tide (Height above a defined point)
	-	Low Tide (Height below a defined point)
Projector steering	+	Steer forward
	-	Steer backward

2.3 Vessel Axes

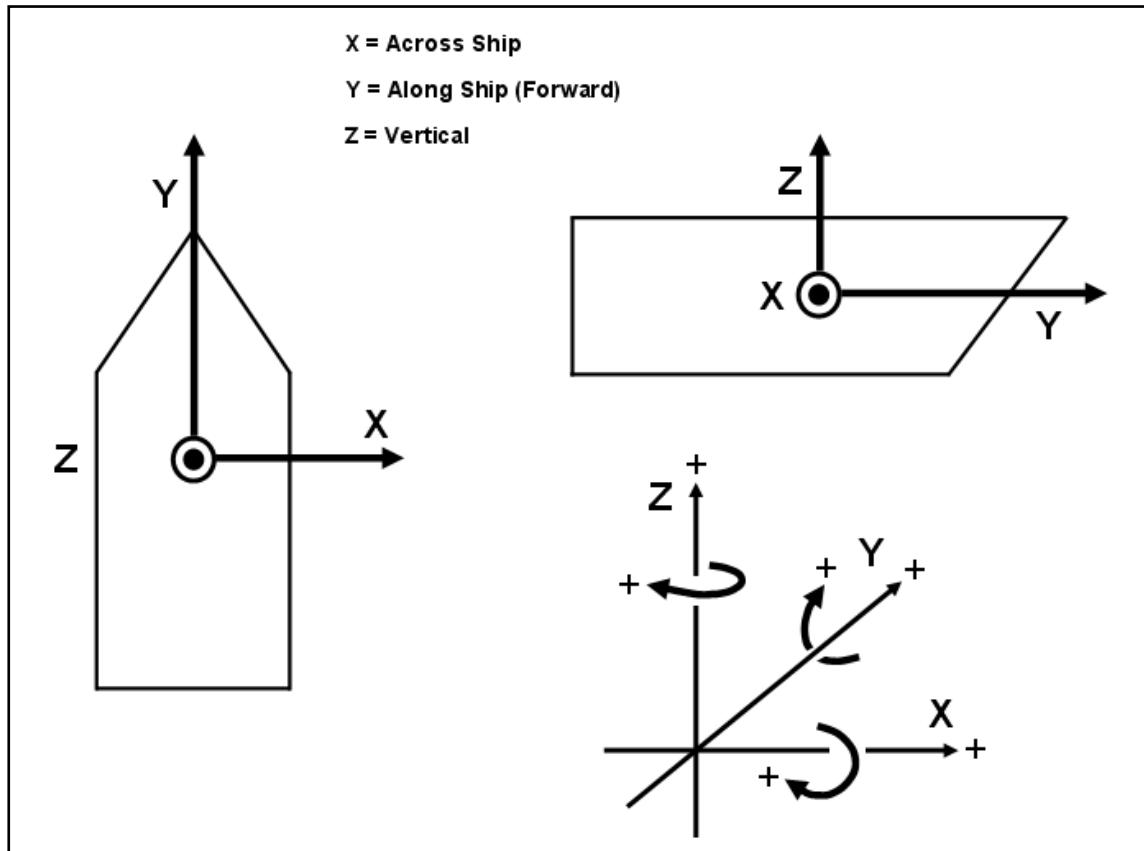

Figure 2-1: Vessel Axes

2.4 Sonar Reference Point

The following axis convention is applied for the sonar reference point convention:

X = across ship, points to starboard

Y= along ship points forward

Z = vertical, points up.

The sonar reference point is in the center of the receiver face in both X and Z directions and in the center of the projector in the Y direction.

The Tx offset is defined as the separation of the projector (Tx) reference point from the Receiver (Rx) point.

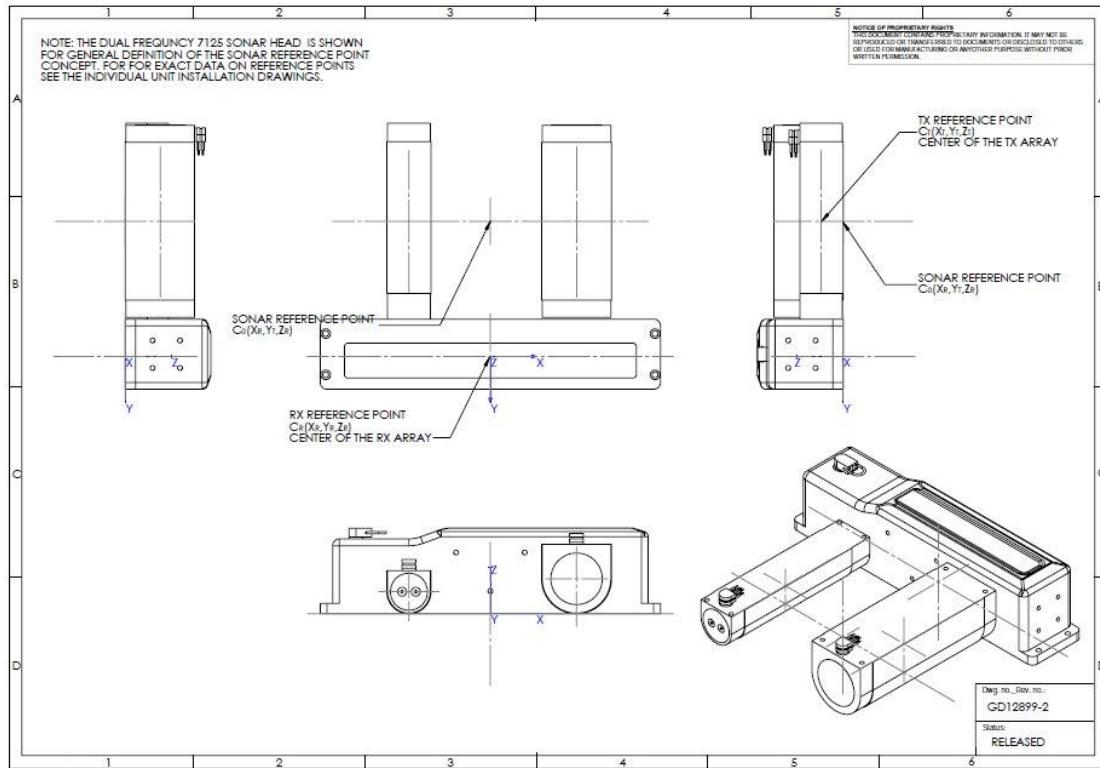

Figure 2-2: Sonar reference point (for reference only)

2.5 Beam Positions

In a standard installation, beam zero represents the first beam on the port side of the sonar array. A reversed head mount system require the beam order be reversed by post processing software and may not need to be done in the 7k software.

Setting the "Projector Orientation" in the UI does NOT reorder beams in the data output.

2.6 Data Type Definitions, Bit Fields

The following data type formats are defined by this document. Data shall be represented in little Endian (Intel) byte-order format unless stated otherwise.

- **Unsigned Integer Values:** 'uX' is an unsigned integer, X bits wide. (e.g., u32 = unsigned 32 bits.)
- **Signed Integer Values:** 'iX' is a signed integer, X bits wide. (e.g. i16 = signed 16 bits.) Signed integers utilize two's complement notation.
- **Floating Points:** Either f32 or f64 (IEEE 1754-1994).
- **Character:** c8.

Bit fields are frequently used in the data format. A bit field flag indicates whether a feature is activated or deactivated, or in some cases a value.

2.7 Time Convention

Time tags shall be in UTC unless stated otherwise and use the following 7KTIME structure format:

Table 3: 7KTIME structure format

Name	Size	Description
Year	u16	0-65535, all four digits must be used (for example, "2004" rather than "04")
Day	u16	1-366
Seconds	f32	0.000000-59.999999
Hours	u8	0-23
Minutes	u8	0-59

NOTE

If no time is available then all fields will be zero.

Also reference the 7KTIME definition in the Data Record Frame description as well as the general section regarding time stamping.

3 GETTING STARTED WITH 7K SONAR SOURCE SOFTWARE

3.1 Establishing a Connection

Two communication methods are available to the 7k sonar source: TCP/IP and UDP/IP. Before sending and receiving records to and from the 7k sonar source, a socket must be created and a connection to the 7k sonar source must be established.

A TCP socket must be connected in the sense that it negotiates an error-checking interaction with the socket in the 7k sonar source. The sonar will act as the server for the TCP/IP connection. A UDP socket is simpler to create, however it has no error checking or guaranteed delivery. With UDP, a socket is created, and then a record is sent to the IP address and port for the 7k sonar source to create a connection. TCP/IP is the recommended choice for communicating to the 7k sonar source application.

The standard port used by the 7k sonar source is 7000. All clients must initiate communication on this port.

3.2 Retrieving Data Records

When communicating to the 7k sonar source, it is crucial that the Protocol field in the Data Record Frame and Network Frame be populated correctly. Refer to *Table 4: Version Concordance* to identify the correct protocol version for your system. Now only version 5 is used.

Table 4: Version Concordance

Protocol Version (DRF and NF)	DFD Version	Record
5	0.54 +	1
4	0.51 – 0.53	-
3	0.48 – 0.50	-
2	0.32 – 0.47	-
1	0.1 – 0.31	-

There are two methods for retrieving data from the 7k sonar source:

- Request a single record
- Subscribe to records

A single record request will result in one record being returned. These are not available for certain data records to prevent system overloading.

In contrast, subscription requests provide streaming data records from the 7k sonar source for each ping or when newer data is available. For external sensor data, a subscription is updated when newer data is available from the source device or application.

The following list defines the most common single record requests:

- Configuration Data (7001)
- System State (7503)
- Data Storage Status (7052)
- 7k System Events (7050)

There are many records that can be subscribed to and requested. The following list provides some critical records needed for ping-to-ping logging and sonar data processing (this is system and user dependent):

- **7503** – Remote Control Sonar Settings
- **7004** – Beam Geometry
- **7007** – Side-scan data
- **7018** – Beamformed data
- **7027** – Raw Bathymetry
- **7028** – Snippet
- **7051** – 7k System event messages

NOTE

If there are multiple devices attached to the 7k sonar source, you must subscribe to a specific set of records for each device using separate subscription requests.

3.3 Getting System State Information and Commanding

To obtain startup and system state information the client can request a single 7001. Because the requesting program is not expected to know what devices are attached until that record is received. The 7k sonar source will accept a device ID of 7000 and system enumerator 0 in the DRF/NF for this request.

When the 7001 record has been received, a listing of attached devices can be extracted from that record. The most important information for communication to the 7k sonar source is the device ID (such as “7101” or “7125”) and the system enumerator (always zero if there is only one device attached).

Following this client synchronization, a 7000 or 7503 (Sonar settings) record can be requested to get current system info for each attached device.

Record 7500 is the primary means of changing sonar settings (for a definition of the 7500 record, [see section 10.62 7500 – Remote Control](#)).

For a detailed description, see [section 11 7k Remote Control Definitions](#). When commanding the sonar, you must supply a valid device ID and enumerator in the 7500’s Data Record Frame or the command will be rejected.

NOTE

It is possible to bypass the configuration process and hard code the device ID values when deemed appropriate, for instance when simple data logging is needed with little commanding of the sonar.

3.4 Terminating Communication

The 7500/1053 command to the 7k sonar source will stop all subscriptions that match the information provided in the command record. The 1053 command is specific for each device, so a separate 7500/1053 must be sent for each device. The 7500/1053 command should be sent so that the 7k sonar source is in a well-known state and not still trying to send data to the requesting program. In the case of TCP, closing the socket will stop the data preparation; but UDP does not do so. **UDP links must be explicitly terminated** (see section 11 *7k Remote Control Definitions*).

3.5 Record Fragmentation – Special Considerations

The maximum size of packets sent by the 7k sonar source has been set to 60,000 bytes. There are two reasons for this:

- UDP packet sizes are limited to an implementation-dependent size, usually 64KB.
- If the data is sent in a very large record, the error checking in TCP will require resending of the entire record should a transmission error occur.

For these reasons, the choice has been made to limit the size of packets in all cases. That means that the receiving program must reconstruct the full record from the fragments.

When a record is fragmented, each fragment is sent as a separate packet. The NETWORK_FRAME at the beginning of each data segment contains the information necessary to rebuild the record. Two separate numbering schemes are available for reconstruction.

NOTE

The RECORD_FRAME for the record is not repeated for each packet. It is only present for the first packet of a record.

3.5.1 From Record Counts

In each NETWORK_FRAME, there is a sequence_number field and a total_packets field. All that is necessary is to join the data parts of each packet to the data segments of the preceding packets, stopping when the sequence_number is one less than the total_packets value (the latter is the same in every packet of a record). (While total_packets is the actual number of packets, sequence_number is zero-based.)

The data portion of each packet begins at the location specified in the NETWORK_FRAME's offset field, which gives the position (in bytes) of the first data byte, relative to the beginning of the NETWORK_FRAME. Note that the size of each received packet is returned by the socket code that receives the packets, and the last packet will probably not be 60,000 bytes in length.

3.5.2 From Accumulated Packet Sizes

Reconstructing records from packet sizes is much like using record counts. The data sections are located and appended into a complete record as they are received. The accumulated data byte count is kept and compared to the total_size field of the

NETWORK_FRAME (the same in each packet of a record). The record is complete when the accumulated size equals the total size.

3.5.3 Error Checking

Several error checks are possible on the incoming data. For TCP, there should be no transmission errors, but communications links could be dropped. For UDP, packets can be lost or appear out of order (but on small networks, that is extremely unlikely).

As each packet is received, the sequence numbers of the packets can be examined. Also, since all the packets except for the final one are of known size (data section 60,000 bytes less the size of the NETWORK_FRAME), the accumulated size that should be present for a given sequence number can be easily verified to see if packets have been lost.

These assume that the data are all present and are all in order and that no fragments of one fragmented record arrive interspersed between packets of another fragmented record. While this is a reasonable assumption on a small network, it is not necessarily true in general.

4 TCP AND UDP

TCP sessions should conform to RFC 793 extensions. UDP session should conform to RFC 768 and later extensions.

Unless otherwise stated, TCP connections should not use the Nagle algorithm to minimize network latency.

Both source and destination port must be populated with a unique port number for TCP and UDP transmissions.

5 7K RECORD DEFINITION

A 7k record consists of a data record frame, a record type header, an optional record data section, and an optional data section for extra information. The Record Data section is considered optional because some remote controls commands consist only of the RTH.

The optional data field typically holds sensor-specific data and third party developer embedded data.

When 7k records are transmitted over a network, a network frame shall precede each record.

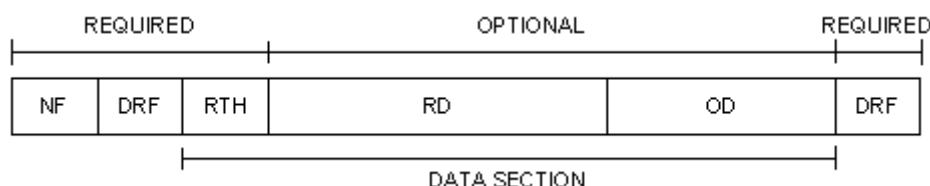

Please note that the Checksum is a required portion of the DRF, which occurs as the last four bytes of every record.

7k RECORD

- DRF – Data Record Frame
- RTH – Record Type Header
- RD – Record Data
- OD – Optional Data

Network prepared with the Network Frame (NF).

NOTE

When sonar software capabilities improve the need to modification / extension of the 7k protocol is mandatory. However, the 7k DFD will always be modified in such a way backwards compatibility is maintained as good as possible. This means reserved fields are used when available. When these are not available, fields will always be added to the end of a record section. It is therefore important to read / parse the protocol using the record size.

Because the protocol is backwards compatible, there is no need to include DFD version numbering in the records.

6 DATA RECORD FRAME

The Data Record Frame (DRF) is the wrapper in which all records (sensor data or otherwise) shall be embedded. The sync pattern combined with the checksum should aid recovery in the event a file becomes corrupted. A record frame shall always start with the version and offset fields and can be used to dynamically determine the protocol version, if necessary.

The frame is defined as follows:

Table 5: Data Record Frame

Name	Size	Description
Protocol Version	u16	Protocol version of this frame (see <i>Table 4: Version Concordance</i>)
Offset	u16	Offset in bytes from the start of the sync pattern to the start of the Record Type Header (RTH). This allows for expansion of the header whilst maintaining backward compatibility.
Sync pattern	u32	0x0000FFFF
Size	u32	Size in bytes of this record from the start of the Protocol version field to the end of the checksum field — including any embedded data
Optional data offset	u32	Offset in bytes to optional data field from start of record. Zero (0) bytes implies no optional data.
Optional data identifier	u32	User defined
7KTIME	u8 * 10	Time tag indicating when data was produced
Record version	u16	Currently 1
Record type identifier	u32	Identifier for record type of embedded data
Device identifier	u32	Identifier of the device to which this data pertains. See appendix B for a overview.
Reserved	u16	Reserved
System enumerator	u16	The enumerator is used to differentiate between devices with the same device identifiers in one installation/system. For example, on 7125 200khz/400kHz dual-frequency systems, the enumerator will normally be zero (0) in 200khz mode, and one (1) in 400kHz mode.
Reserved	u32	Reserved

Name	Size	Description
Flags	u16	<p>BIT FIELD:</p> <p><u>Bit 0:</u> Checksum 0 – Invalid checksum 1 – Valid checksum</p> <p><u>Bit 1-14:</u> Reserved (must be zero)</p> <p><u>Bit 15:</u> 0 – Live data 1 – Recorded data</p>
Reserved	u16	Reserved
Reserved	u32	Reserved
Total records in fragmented data record set	u32	Always zero
Fragment number	u32	Always zero
DATA SECTION	Dynamic	Data section
Checksum	u32	Sum of all byte values (treated as unsigned) in the record from the beginning of the version field to the end of the data section. The use of this field is optional and depends on bit 1 of the Flags field. The checksum should be computed as a 32 bit unsigned integer.

6.1 7K Interface and Integrated Dual Head T50-R or T20-R

The 7k Interface works as follows for the integrated dual head system T50-R or T20-R

The XML file passed by the 7k sonar source in the 7001 – 7k Configuration message must contain a SystemInfo tag, with an attribute IDH set to “yes”.

For example:

```
<SystemInfo auv="no" IDH="yes" projectid="generic" systemrelease="SV3"
name="T50-R">T50-R Sonar</SystemInfo>
```

This allows for identifying a dual head integrated system, such as the T50-R, when a 7001 - 7k Configuration message is received.

When IDH is set to “yes”, the System enumerator field on the Data Record Frame can be either 0, 1 or 2.

When a 0 is received the message should be processed for both sonars; port and starboard. When set to 1 the message should be processed for the port sonar only. When set to 2 it should be processed for the starboard sonar only.

The System enumerator can be used to separate messages with system wide information from messages containing sonar specific data.

Subscribe to enumerator 0 to receive data from both heads. Subscribe to enumerator 1 or 2 to receive data from only the port or starboard head.

6.2 7K Interface and HydroSweep Sonars

Also when connecting to a HydroSweep 3rd Generation (HS3) sonar the 7001 record needs to be requested to obtain the system XML files describing the system. The XML file contains next to other data the device ID and device enumerator together with the system description.

The sonar (remote) control messages are all done using enumerator 0.

Date need to be obtained by using a single record or data feed request using proper device ID and enumerator of the required data.

Table 6: Enumerator

Enumerator	Operation mode
0	Frequency band PHF (Bathymetry)
1	Frequency band SHF (Secondary High Frequency)
2	Frequency band SLF (Secondary Low Frequency)
3	Frequency band PLF (Primary Low Frequency)

(Refer also to chapter 3.3 Getting System State Information and Commanding)

6.2.1 Segments

Each segment has a delayed transmit pulse.

A higher transmit power level is achieved by using segmented transmit.

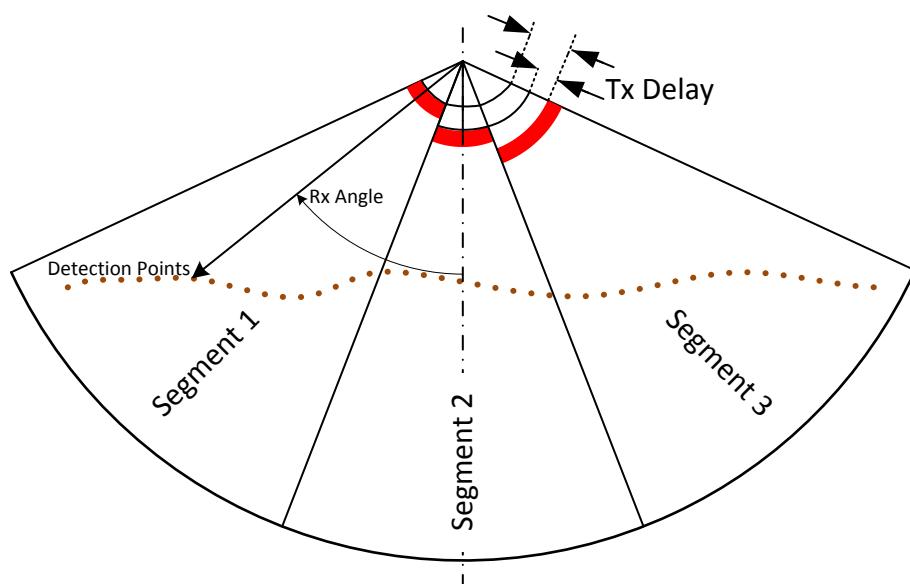

Figure 6-1: Segments

7 TCP AND UDP NETWORK FRAME

Records will be packetized using the following prefixed header for both the TCP and UDP/IP protocols. Packet sizes may not vary in a sequence, except for the last packet.

When using UDP protocol, each packet shall be less than or equal to 64K bytes, including the network header.

The following header shall prefix the network packet:

Table 7: Network Frame

Name	Size	Description
Protocol version	u16	Protocol version of this frame (see <i>Table 4: Version Concordance</i>)
Offset	u16	Offset in bytes to the start of data from the start of this packet
Total packets	u32	Number of network packets for set of records transmitted
Total records	u16	Always 1.
Transmission identifier	u16	Transmission identifier (helper field for packet assembly). Must be the same number for each network packet in transmission. Adjacent transmissions in time from one source may not use the same identifier.
Packet size	u32	Size in bytes of this packet including the header and appended data
Total size	u32	Total size in bytes of all packets in transmission, excluding network frame(s)
Sequence number	u32	Sequential packet number; allows correct ordering during reconstruction. Range = 0 to n-1 packets
Destination device identifier	u32	0 – Unspecified 0xFFFFFFFF – Not used Any other number is a valid address
Destination enumerator	u16	Destination enumerator unless destination device identifier is unspecified or not used
Source enumerator	u16	Source enumerator unless Source Device Identifier is unspecified or not used
Source device identifier	u32	0 – Unspecified 0xFFFFFFFF – Not used Any other number is a valid address

8 LOGGING FILE FORMAT

8.1 Overview

A valid 7k data file shall be a binary file consisting of a series of data records conforming to the conventions and definitions in this document.

Records must be complete and without the network frame.

A file header record (7200) is recommended to be the first record in each file. This file describes the file's contents.

8.2 File Nomenclature

It is recommended that file names be based on the UTC date and time when they are created and utilize an '.s7k' extension as follows:

"YYYYMMDD_HHMMSS.s7k"

With:

YYYY = Year

MM = Month

DD = Day

HH = Hour

MM = Minutes

SS = Seconds

For example, 20100516_102852.s7k (Created May 16, 2010 at 10:28:52)

When using third party logging tools, multiple files created at the same time can be differentiated by appending _X to the filename (where "X" is an integer starting at zero and successively incremented for each file).

For example, 20100516_102852_0.s7k and 20100516_102852_1.s7k

In case of a dual head system M_ for master and S_ for slave is added in front of the file name.

For example M_20100516_102852.s7k (Master file Created May 16, 2010 at 10:28:52).

8.3 7k Sonar Source Logged Files

The 7k sonar source logs data in order it is received. In the case of sonar data, this guarantees that the pings are logged in sequential (and therefore chronological) order. In general, however, the data in a log file cannot be guaranteed to be in chronological order.

Record 7052 (7K Data Storage Status) can be used to determine which records are available and current record logging filters. Remote command 1209 (Set Filtering) is used to set the record logging filters.

Complete files generated using RESON 7k sonar source software will always begin with a 7200 record and will usually be followed by a 7001 record and contain a 7300 record as the last record in the file. This record is for RESON diagnostic use only.

Incoming 7k Remote Controls (record 7500) are not logged in 7k files generated by the 7k sonar source. Remote controls activity is stored in a separate log file. These files are for RESON diagnostic use only. Network Frames are also not logged.

The default extension for 7k sonar source logged files is *.s7k, where the '*' represents the filename.

9 TIME TAGGING

Through the IO Module the time of the system has to be synced with a PPS and a time message from a GPS (for instance a ZDA message).

Time tags reside in the DRF for each record. The time stamp in the record is always the time at which the data, contained in the record, was generated. It does not refer to the time that the record was formatted or sent.

For ping related records, the time stamp refers to the time when the sonar transmitter finishes a ping.

The time stamping for messages received from a sensor depends on the selected driver in the IO Module. In general, the position will use time in message and other sensors use time of arrival of the first character. For some sensors (e.g. POS MV), the time will be time in message; the time as is defined in the message string.

10 RECORD TYPE DEFINITIONS

10.1 Overview

The following table summarizes the allocated record type identifiers for the RESON 7k sonar and generic sensors. This table is not necessarily a complete listing of allocated or reserved record types.

Table 8: Record Type Definitions

Record Type	Description
1000 – 1999	Reserved for generic sensor records
1000	Reference point
1001	Sensor offset position
1002	Sensor offset position calibrated
1003	Position
1004	Custom attitude information
1005	Tide
1006	Altitude
1007	Motion over ground
1008	Depth
1009	Sound velocity profile
1010	CTD
1011	Geodesy
1012	Roll pitch heave
1013	Heading
1014	Survey line
1015	Navigation
1016	Attitude
1017	Pan tilt
1020	Sonar installation identifiers
1021	Reserved for IDH (Integrated Dual Head)
1022	Reserved for IOP motion
1050	Reserved for generic sensor calibration
1200	Reserved for generic side-scan sonar
1500 – 1599	Reserved for future QC records
2004	Sonar Pipe Environment
3001	Contact Output

Record Type	Description
7000 – 7999	Reserved for SeaBat™ 7k records
7000 ¹	7k sonar settings
7001	7k configuration
7002	7k match filter
7003	7k firmware and hardware configuration
7004	7k beam geometry
7005	Reserved for 7k calibration data
7006	7k bathymetric data Record 7006 is superseded by record 7027. The record is deprecated and will not be supported by latest 7k protocol based applications such as the Teledyne Odom MBCenter. It exists for backwards compatibility only.
7007 ²	7k side-scan data
7008 ¹	7k generic water column data Record 7008 is superseded by 7018 and 7028. It is mutually exclusive. The record is deprecated and will not be supported by Teledyne RESON. It exists for backwards compatibility only.
7009	Reserved for vertical depth
7010 ¹	TVG values
7011 ¹	7k image data
7012 ¹	7k ping motion data
7014	7k Adaptive gate
7016	Reserved for extended bottom detect info
7017 ¹	7k detection data setup The record is deprecated and will not be supported by Teledyne RESON.
7018 ¹	7k beamformed data
7021	7k built-in test environment data
7022	7k sonar source version
7023	8k wet end version
7024	Reserved for license information
7026 ¹	Reserved for 7k detection data
7027 ¹	7k raw detection data
7028 ¹	7k snippet data

¹ These records are available by subscription only.

² These records are available by subscription only.

Record Type	Description
7029	Vernier Processing Data (Filtered)
7030	Reserved for sonar installation parameters
7031	7k Built-In Test Environment Data (Summary)
7037	Reserved for raw I & Q data file header
7038 ¹	Reserved for raw I & Q data
7040	Reserved for 7k Tx configuration files
7041 ¹	Compressed beamformed magnitude data
7042 ¹	Compressed Water Column data
7047 ¹	7k Segmented raw detection data
7048	7k Calibrated beam data
7050	7k system events
7051	7k system event message
7052	RDR recording status
7053	7k subscriptions
7055	Normalization status
7057	Calibrated side-scan data
7058	Snippet Backscattering Strength
7059	MB2 specific status
7060	Reserved for 7k target data
7068 ¹	Reserved
7200	7k file header
7300	7k file catalogue record
7310	Reserved for 7k trigger
7311	Reserved for 7k trigger sequence setup
7312	Reserved for 7k trigger sequence done
7400	7k time message
7401 – 7499	Reserved for future time messages
7500	7k remote control
7501	7k remote control acknowledge
7502	7k remote control not acknowledge
7503	7k remote control sonar settings
7504	7P sensor settings
7505	Reserved
7510	SV Filtering

¹ These records are available by subscription only.

Record Type	Description
7511	System lock status
7515	Timestamp (not described in the documentation)
7610	7k sound velocity
7611	7k absorption loss
7612	7k spreading loss
7613	Reserved
7777	Reserved for filler records (used when repairing corrupt files)
7900 – 7999	Reserved
8012 ¹	Pitch, yaw, heave flag (not described in the documentation)
8100	8k series sonar data (not described in the documentation)
11000 – 11299	Reserved
81000 – 87999	Reserved

Not all records shown in this section are available for all systems. Availability of certain records will depend on the specific installation. In most cases, only SeaBat™ relevant data is produced from the 7k sonar source.

The record types mentioned in the following table are the record types that are logged for the different 7k systems.

NOTE
✓ : Record applies for specified 7k System.
Empty field: This combination of 7k System and record is not supported by Teledyne RESON and thus it is not guaranteed that the data in the possible generated record is valid.

Table 9: Available Record Types per 7k System

Record Types	7K logger(See Note 1)	7k Systems

NOTE 1

Messages 7K logger via the 7K Center connected to the 7K Logger.

NOTE 2

Record 7006 is superseded by record 7027. The record is deprecated and will not be supported by latest 7k protocol based applications such as the Teledyne Odom MBCenter. It exists for backwards compatibility only.

NOTE 3

Record 7008 is superseded by 7018 and 7028. It is mutually exclusive. The record is deprecated and will not be supported by Teledyne RESON. It exists for backwards compatibility only.

NOTE 4

The record is deprecated and will not be supported by Teledyne RESON. It exists for backwards compatibility only.

NOTE 5

Record 7027 is for HydroSweep sonars only available until CM version 3.3.0.11. Higher CM versions only support record 7047.

10.2 1000 – Reference Point

Description: Reference point Information.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 10: 1000 – Record Type Header

Name	Size	Description
Vehicle's X reference point to center of gravity	f32	X offset in meters
Vehicle's Y reference point to center of gravity	f32	Y offset in meters
Vehicle's Z reference point to center of gravity	f32	Z offset in meters
Water level to center of gravity	f32	In meters

NOTE

For submersible vehicles, since the vertical offset from the COG to the water level is not fixed, the offsets should be set to zero. Typically, the offsets to the depth sensor combined with the reported depth at the sensor and the vehicle attitude would be used to determine the depth of the COG and reference point.

10.3 1001 – Sensor Offset Position

Description: Sensor offset position information data (non-calibrated).

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 11: 1001 – Record Type Header

Name	Size	Description
Sensor position X offset	f32	X offset from vehicle reference point in meters
Sensor position Y offset	f32	Y offset from vehicle reference point in meters
Sensor position Z offset	f32	Z offset from vehicle reference point in meters
Sensor roll angle offset	f32	Roll angle offset in radians
Sensor pitch angle offset	f32	Pitch angle offset in radians
Sensor yaw angle offset	f32	Yaw angle offset in radians

10.4 1002 – Sensor Offset Position Calibrated

Description: Sensor offset position information data (calibrated).

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 12: 1002 – Record Type Header

Name	Size	Description
Sensor position X offset	f32	X offset from vehicle reference point in meters
Sensor position Y offset	f32	Y offset from vehicle reference point in meters
Sensor position Z offset	f32	Z offset from vehicle reference point in meters
Sensor roll angle offset	f32	Roll angle offset in radians
Sensor pitch angle offset	f32	Pitch angle offset in radian
Sensor yaw angle offset	f32	Yaw angle offset in radians

10.5 1003 – Position

Description: Position Record used in conjunction with Record Type 1011.

NOTE
1003 record created by the 7k sonar source is using the sensor (GPS) data. Teledyne PDS is using reference point data.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 13: 1003 – Record Type Header

Name	Size	Description
Datum identifier	u32	0 – WGS84 >0 – Reserved
Latency	f32	In seconds
Latitude or northing	f64	Latitude in radians or northing in meters
Longitude or easting	f64	Longitude in radians or easting in meters
Height relative to datum or height	f64	In meters
Position type flag	u8	0 – Geographical coordinates 1 – Grid coordinates
UTM zone	u8	UTM Zone
Quality flag	u8	0 – Navigation Data 1 – Dead-Reckoning

Name	Size	Description
Positioning method	u8	0 – GPS 1 – DGPS 2 – Start of inertial positioning system from GPS 3 – Start of inertial positioning system from DGPS 4 – Start of inertial positioning system from bottom correlation 5 – Start of inertial positioning from bottom object 6 – Start of inertial positioning from inertial positioning 7 – Start of inertial positioning from optional data 8 – Stop of inertial positioning system to GPS 9 – Stop of inertial positioning system to DGPS 10 – Stop of inertial positioning system to bottom correlation 11 – Stop of inertial positioning to bottom object 12 – Start of inertial positioning to inertial positioning 13 – Start of inertial positioning to optional data 14 – User defined 15 – RTK Fixed 16 – RTK Float
Number of Satellites	u8	Optional

10.6 1004 – Custom Attitude Information

Description: Attitude Data Record. The length of this record is dynamic and is based on the field mask. The bit field mask determines which elements make up a sample of fields in a given record. The number of samples (N) determines how many samples are repeated in a record at the specified sample rate (Frequency).

NOTE

This is a custom field designed for advanced users who have specific needs. Normally, records 1012 and 1013 will be used.

Data Definition:

DRF	RTH	RD	OD	DRF

SAMPLE N-1 Sound velocity	f32	In meters/seconds
SAMPLE N-1 Absorption	f32	In dB/kilometer

10.13 1011 – Geodesy

Description: The Geodesy data record may be used to define the spheroid, datum, and grid definitions for navigational data; each sequentially embedded within the RTH. The optional data portion of the record is used to contain custom projection parameters.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 25: 1011 – Record Type Header

Name	Size	Description
Spheroid name	c8 * 32	A short text description of the spheroid name: e.g. "WGS84"
Semi-major axis	f64	Semi-major axis in meters: e.g., 6378137.0 for WGS84
Inverse flattening	f64	Inverse flattening in meters: e.g. 298.257223563 for WGS84
Reserved 1	u8 * 16	Reserved
Datum name	c8 * 32	Datum name: e.g. "WGS84"
Data calculation method	u32	0 – Molodensky 1 – Bursa / Wolfe 2 – DMA MRE 3 – NADCON 4 – HPGN 5 – Canadian National Transformation V2
Number of parameters	u8	Three (3), seven (7) and eight (8) parameter transformation is supported
DX	f64	X – Shift (m)
DY	f64	Y – Shift (m)
DZ	f64	Z – Shift (m)
RX	f64	X Rotation (radians)
RY	f64	Y Rotation (radians)
RZ	f64	Z Rotation (radians)

Name	Size	Description
Scale	f64	Device scaling
Reserved 2	u8 * 35	Reserved for later extension to 9 parameter transformation
Grid name	c8 * 32	Name of grid system in use: e.g. "UTM" (see APPENDIX C)
Grid distance units	u8	0 – Meters 1 – Feet 2 – Yards 3 – US Survey Feet 4 – Kilometers 5 – Miles 6 – US Survey Miles 7 – Nautical Miles 8 – Chains 9 – Links
Grid angular units	u8	0 – Radians 1 – Degrees 2 – Degrees, minutes, seconds 3 – Gradians 4 – Arc-seconds
Latitude of origin	f64	
Central meridian	f64	
False easting	f64	Meters
False northing	f64	Meters
Central scale factor	f64	
Custom identifier	i32	Used to define projection specific parameters -2 – Custom -1 – Not used (Refer to APPENDIX C)
Reserved 3	u8 * 50	Reserved

For a list of currently reserved Custom Identifiers, see *APPENDIX B Device Identifiers*.

10.14 1012 – Roll Pitch Heave

Description: Motion Data Record.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 26: 1012 – Record Type Header

Name	Size	Description
Roll	f32	Vessel roll in radians
Pitch	f32	Vessel pitch in radians
Heave	f32	Vessel heave in meters

10.15 1013 – Heading

Description: Vessel Heading Record.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 27: 1013 – Record Type Header

Name	Size	Description
Heading	f32	Vessel heading in radians

10.16 1014 – Survey Line

Description: This record describes the survey line or route associated with the data in this file.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 28: 1014 – Record Type Header

Name	Size	Description
Waypoint count (N)	u16	Number of points in the line / route
Position type	u16	0 – Latitude/Longitude 1 – Grid coordinates
Radius	f32	Turn radius between line segments (meters) 0 – No curvature in turns
Line name	c8 * 64	Null terminated string – line name

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 29: 1014 – Record Data

Name	Size	Description
Latitude or northing 0	f64	Latitude (radians) or northing (meters) - $\pi/2$ to $\pi/2$, -south
Longitude or easting 0	f64	Longitude (radians) or easting (meters) - π to π , -west
...
Latitude or northing N-1	f64	Latitude (radians) or northing (meters)
Longitude or easting N-1	f64	Longitude (radians) or easting (meters)

10.17 1015 – Navigation

Description: This record will be output at the input navigation rate.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 30: 1015 – Record Type Header

Name	Size	Description
Vertical reference	u8	1 – Ellipsoid 2 – Geoid 3 – Chart datum
Latitude	f64	Latitude of vessel reference point in radians - $\pi/2$ to $\pi/2$, -south
Longitude	f64	Longitude of vessel reference point in radians - π to π , -west
Horizontal position accuracy	f32	Position accuracy in meters
Vessel height	f32	Height of vessel reference point above vertical reference in meters
Height accuracy	f32	In meters
Speed over ground	f32	Speed over ground at position time in m/s
Course over ground	f32	Course over ground at position time in radians
Heading	f32	Heading of vessel at position time in radians

10.18 1016 – Attitude

Description: This record will be output at the input motion sensor rate.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 31: 1016 – Record Type Header

Name	Size	Description
Number of attitude data sets	u8	Number of data sets

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 32: 1016 – Record Data

Name	Size	Description
Time difference from record timestamp 0	u16	Time difference in milliseconds
Roll [0]	f32	Roll measured in radians
Pitch [0]	f32	Pitch measured in radians
Heave [0]	f32	Heave measured in meters
Heading [0]	f32	Heading of vessel in radians
...
Time difference from record timestamp [N-1]	u16	Time difference in milliseconds
Roll [N-1]	f32	Roll measured in radians
Pitch [N-1]	f32	Pitch measured in radians
Heave [N-1]	f32	Heave measured in meters
Heading [N-1]	f32	Heading of vessel in radians

10.19 1017 – Pan Tilt

Description: This record is the pan tilt input from an external source.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 33: 1017 – Record Type Header

Name	Size	Description
Pan	f32	Angle in radians
Tilt	f32	Angle in radians

10.20 1020 – Sonar Installation Identifiers

Description: This record gives the information on the MBES Linear and Angular Offsets and the wet-end configuration. XYZ offsets are measured from the Sonar Reference Point (SRP) to the acoustic center of the Tx array and to the acoustic center of the Rx array. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 34: 1020 – Record Type Header

Name	Size	Description
System Identification Number	u32	Sonar ID
Transmitter Identification Number	u32	Tx Unit ID
Receiver Identification Number	u32	Rx Unit ID
Standard Configuration Options ^(*)	u32	0 = Custom Otherwise this specifies system dependant standard installation parameters and all installation defined parameters below are ignored.
Configuration Fixed Parameters ^(**)	u32	Defines configuration's defined parameters BIT FIELD, 1 = fixed: <u>Bit 0-2:</u> Tx to Rx XYZ Linear Offsets <u>Bit 3-5:</u> Tx to Reference XYZ Linear Offsets <u>Bit 6-8:</u> Tx to Rx Angular Offsets <u>Bit 9-15:</u> Reserved
Tx Length (Y)	f32	Measured values of Tx hardware, in meters. Flat arrays set to 0.
Tx Width (X)	f32	
Tx Height (Z)	f32	
Tx Radius	f32	
SRP to Tx X Linear Offset	f32	XYZ linear offsets from the SRP to the acoustic center of the transmitter, in meters.
SRP to Tx Y Linear Offset	f32	
SRP to Tx Z Linear Offset	f32	
Tx Roll Angular Offset	f32	Angular offsets are from array main axes to motion axes in Lagrange coordinates, in radians.
Tx Pitch Angular Offset	f32	
Tx Yaw Angular Offset	f32	

Name	Size	Description
Rx Length (Y)	f32	Measured values of Tx hardware, in meters. Flat arrays set to 0.
Rx Width (X)	f32	
Rx Height (Z)	f32	
Rx Radius	f32	
SRP to Rx X Linear Offset	f32	XYZ linear offsets from the SRP to the acoustic center of the receiver, in meters.
SRP to Rx Y Linear Offset	f32	
SRP to Rx Z Linear Offset	f32	
Rx to Rx Roll Angular Offset	f32	Angular offsets are from array main axes to motion axes in Lagrange coordinates, in radians.
Rx Pitch Angular Offset	f32	
Rx Yaw Angular Offset	f32	
Frequency	f32	System frequency
VRP to SRP Offset (X)	f32	XYZ linear offsets from the vessel reference to the sonar reference point, in meters.
VRP to SRP Offset (Y)	f32	
VRP to SRP Offset (Z)	f32	
Cable length	u32	Cable length in meters for DMPA systems. 0 when not set.
Reserved	u8 * 44	This field is reserved for system specific parameters and will be defined on per system basis.

(*) When this record is received by 7k sonar source, all offset fields that are fixed for specified configuration are ignored and factory values are used. When this record is sent by 7k sonar source, all offset fields are filled in with the offsets in use, and configuration is set to the last received. All standard configurations will be defined on per system basis.

(**) When this record is received by 7k sonar source, this field is ignored. When this record is sent by 7k sonar source, this field specifies which fields are fixed for the specified configuration.

10.21 2004 – Sonar Pipe Environment

Description: Sonar pipe environment from Sonar UI Pipe Detection and Tracking system. This record is a five point description of a tracked pipe line. Pipe environment records are only available for finalized points of a tracked pipe line. The Cartesian coordinates are in sonar space and are for reference only. Points can be positioned between two sonar beams on the ping.

Due to the way of the pipe detection and tracking system works the five points records are outputted when the algorithm decides the pipe tracking is stable enough to have a proper five points output. That easy can be after a certain amount of pings.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 35: 2004 – Record Type Header

Name	Size	Description
Pipe number	u32	Pipe identifier
Ping time	7kTime (u8*10)	Time
Ping number	u32	Sequential number
Multi-ping sequence	u32	Sub number
Pipe diameter	f32	Diameter of the pipe in meters
Sound velocity	f32	Sound velocity in m/s
Sample rate	f32	Sonar's sampling frequency in Hz
Finished	u8	0 – Pipe is still growing Otherwise – Pipe is finished
Number of points	u32	Number of point sub records. Always 5 (five).
Point sub record size	u32	Size of sub record
Reserved	u32*10	Reserved

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 36: 7001 – Record Data

Name	Size	Description
X	f32	X coordinate in sonar space in meters
Y	f32	Y coordinate in sonar space in ping number
Z	f32	Z coordinate in sonar space in meters
Angle	f32	Point angle in radians
Sample number	f32	Sample number

**NOTE**

The output is five in a sequence: seabed left, trench left, top, trench right and seabed right. (When multibeam X,Y,Z reference frame corresponds with vessel X,Y,Z reference frame.)

NOTE

Device identifier (in DRF) is the sonar .

10.22 3001 – Contact Output

Description: This record is produced by the SeaBat™ 7k sonar 7-P processor. It contains information of a contact the operator creates / modifies / deletes in the Sonar UI.

Data Definition:

Table 37: 3001 – Record Type Header

Name	Size	Description
Target ID	u32	Contact unique ID
Ping number	u32	Sequential number
Operation time	7kTIME (u8 * 10)	Time of contact state operation applied to contact
Operator name	utf8 * 128	Optional textual name of the operator
Contact state	u32	0 – Created 1 – Modified 2 – Deleted
Range	f32	Range from sonar to contact in meters
Bearing	f32	The bearing from sonar center to contact in +/- radians
Information flags	u32	BIT FIELD: <u>Bit 0:</u> Set to 1 if Latitude and Longitude fields contain valid values <u>Bit 1:</u> Set to 1 if Azimuth field contains a valid value <u>Bit 2:</u> Set to 1 if Contact length field contains a valid value <u>Bit 3:</u> Set to 1 if Contact width field contains a valid value

Name	Size	Description
Latitude	f64	Latitude of contact in radians -π/2 to π /2, south negative
Longitude	f64	Longitude of contact in radians -π to π, west negative
Azimuth	f32	Optional azimuth of contact in radians
Contact length	f32	Optional length of contact in meters
Contact width	f32	Optional width of contact in meters
Classification	utf * 128	Optional textual classification given by the operator
Description	utf * 128	Optional textual description given by the operator

NOTE
Device identifier (in DRF) is the sonar .

10.23 7000 – Sonar Settings

Description: This record is produced by the SeaBat™ 7k sonar 7-P processor series. It contains the current sonar settings. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 38: 7000 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
Ping number	u32	Sequential number
Multi-ping sequence	u16	Flag to indicate multi-ping sequence. Always 0 (zero) if not in multi-ping mode; otherwise this is the sequence number of the ping in the multi-ping sequence.
Frequency	f32	Transmit frequency in Hertz
Sample rate	f32	Sample rate in Hertz
Receiver bandwidth	f32	In Hertz
Tx pulse width	f32	In seconds
Tx pulse type identifier	u32	0 – CW 1 – Linear chirp (FM)

Name	Size	Description
Tx pulse envelope identifier	u32	0 – Tapered rectangular 1 – Tukey 2 – Hamming 3 – Han 4 – Rectangular
Tx pulse envelope parameter	f32	Some envelopes don't use this parameter
Tx pulse mode	u16	1 – Single ping 2 – Multi-ping 2 3 – Multi-ping 3 4 – Multi-ping 4
Tx pulse reserved	u16	Reserved
Max ping rate	f32	Maximum ping rate in pings per second
Ping period	f32	Seconds since last ping
Range selection	f32	Range selection in meters
Power selection	f32	Power selection in dB re 1 μ Pa
Gain selection	f32	Gain selection in dB

Projector beam steering angle vertical	f32	In radians
Projector beam steering angle horizontal	f32	In radians
Projector beam -3dB beam width vertical	f32	In radians
Projector beam -3dB beam width horizontal	f32	In radians
Projector beam focal point	f32	In meters
Projector beam weighting window type	u32	0 – Rectangular 1 – Chebychev 2 – Gauss

Name	Size	Description
Projector beam weighting window parameter	f32	N/A
Transmit flags	u32	BIT FIELD: <u>Bit 0-3:</u> Pitch stabilization method <u>Bit 4-7:</u> Yaw stabilization method <u>Bit 8-31:</u> Reserved
Hydrophone identifier	u32	Hydrophone selection
Receive beam weighting window	u32	0 – Chebychev 1 – Kaiser
Receive beam weighting parameter	f32	N/A
Receive flags	u32	BIT FIELD: <u>Bit 0:</u> Roll compensation indicator <u>Bit 1:</u> Reserved <u>Bit 2:</u> Heave compensation indicator <u>Bit 3:</u> Reserved <u>Bit 4-7:</u> Dynamic focusing method <u>Bit 8-11:</u> Doppler compensation method <u>Bit 12-15:</u> Match filtering method <u>Bit 16-19:</u> TVG method <u>Bit 20-23:</u> Multi-ping mode 0 – No multi-ping If non-zero, this represents the sequence number of the ping in the multi-ping sequence. <u>Bit 24-31:</u> Reserved
Receive beam width	f32	Angle in radians
Bottom detection filter info	f32	Min range (if range filter is active)
Bottom detection filter info	f32	Max range (if range filter is active)
Bottom detection filter info	f32	Min depth (if depth filter is active)
Bottom detection filter info	f32	Max depth (if depth filter is active)
Absorption	f32	Absorption in dB/km
Sound velocity	f32	Sound velocity in m/s
Spreading	f32	Spreading loss in dB
Reserved	u16	Reserved

NOTE
<p>Pitch and yaw stabilization are not implemented.</p> <p>When the roll stabilization flag is not zero the beam pattern is roll stabilized; beam pattern is relative the vertical.</p> <p>Projector beam steering is pitch stabilization.</p> <p>Projector beam steering is <u>not</u> redundant when messages 7004 and 7006 are received; this value needs to take into account. (Unless the sonar does not have pitch steer capacity.)</p>

10.24 7001 – Configuration

Description: This record is produced by the SeaBat™ 7k sonar 7-P processor series. It contains the configuration information about the sonar capabilities. Each sonar configuration can be found in the record's module info section (see

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 40). The record is created on system startup and does not change during operation. The record can be manually requested from the 7-P processor. This record is not available for subscription. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

The dynamic data section for each device is encoded using XML. A sample is provided below.

10.25 7002 – Match Filter

Description: This record is produced by the 7k sonar source. It contains the sonar's receive match filter settings. The 7-P processor updates this data for each ping. The record can be manually requested for the last ping or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 41: 7002 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
Ping number	u32	Sequential number
Operation	u32	0 – Off 1 – On
Start frequency	f32	Hz
Stop frequency	f32	Hz
Window type	u32	0 – Rectangular 1 – Kaiser 2 – Hamming 3 – Blackmann 4 – Triangular 5 – X (Taylor)
Shading value	f32	
Effective Pulse Width	f32	Effective pulse width after FM compression (seconds) NOTE: Software versions prior to July 2015 (7k sonar source 5.9.0.1 or older) do not calculate this value. In this case the value will be a very large negative number.
Reserved	u32 * 13	Filled with 0xFB

10.26 7003 – Firmware and Hardware Configuration

Description: This record is produced by the 7k sonar source series. It contains the configuration information about the sonar hardware and firmware. The record is created on system startup and does not change during operation. The record can be manually requested from the 7k sonar source. This record is not available for subscription.

For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

The dynamic data section is encoded using HTM. A sample is provided below.

10.27 7004 – Beam Geometry

Description: This record is produced by the 7k sonar source. It contains the receive beam widths and steering. The 7k sonar source updates this data for each ping. The record can be manually requested for the last ping or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

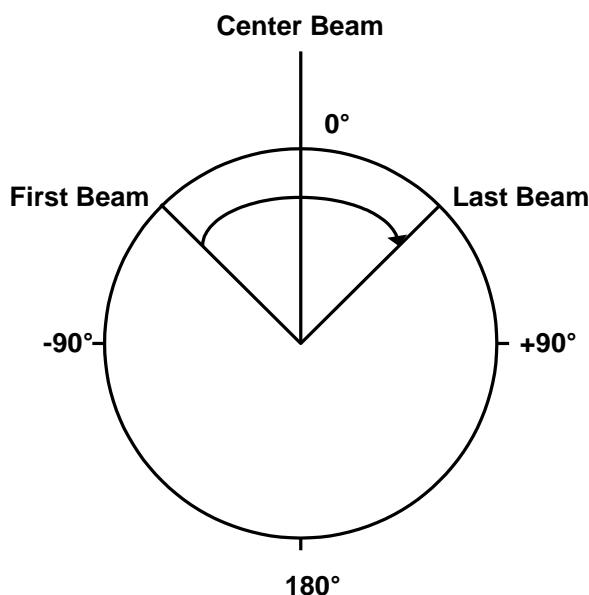

Figure 10-1: Sonar Beam Angle Convention

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 43: 7004 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
N	u32	Number of receiver beams

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 44: 7004 – Record Data

Name	Size	Description
Beam vertical direction angle[N]	f32 * N	Angle in radians. The receiver beam steering angle (relative to nadir) applied in the along-track direction (typically 0).
Beam horizontal direction angle[N]	f32 * N	Angle in radians. The receiver beam steering angle (relative to nadir) applied in the across-track direction (varies according to beam number). Typically -75 to +75 degrees. In equidistant mode, this will not change. In equi-angular mode, steering angles will vary.
-3dB Beam width Y[N]	f32 * N	Angle in radians. The receiver along-track beam width measured at the -3dB points (typically <30°).
-3dB Beam width X[N]	f32 * N	Angle in radians. The receiver across-track beam width measured at the -3dB points (typically <5°).
Tx Delay[N]	f32 * N	<p>Tx Delay for the beam in fractional samples, zero when not applicable.</p> <p>The Tx Delay is not existing on all sonar models. When the sonar does not have Tx Delay the item will not be in the Record Data, check record length in the Data Record Frame.</p>

NOTE

Beam angles are relative to sonar frame when beam stabilization is switched off. When enabled it will be relative to the vertical.

Beam vertical is always zero, angles are relative to sonar frame.

10.28 7006 – Bathymetric Data

NOTE

Record 7006 is superseded by record 7027. The record is deprecated and will not be supported by latest 7k protocol based applications such as the Teledyne Odom MBCenter. It exists backwards compatibility only.

Description: This record is produced by the 7k sonar source series. It contains the sonar bottom detection results. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section *10.62 7500 – Remote Control* together with *section 11 7k Remote Control Definitions*.

Name	Size	Description
Range [N]	f32 * N	Two-way travel time in seconds
Quality [N]	u8 * N	<p>BIT FIELD:</p> <p><u>Bit 0</u>: Brightness 1 – Pass 0 – Fail</p> <p><u>Bit 1</u>: Colinearity 1 – Pass 0 – Fail</p> <p><u>Bit 2</u>: Bottom detection process (magnitude) 1 – Used 0 – Not used</p> <p><u>Bit 3</u>: Bottom detection process (phase): 1 – Used 0 – Not used</p> <p><u>Bit 4</u>: Used internally</p> <p><u>Bit 5</u>: PDS nadir filter 1 – Fail 0 – Pass</p> <p><u>Bit 6-7</u>: Reserved</p>
Intensity [N]	f32 * N	<u>Intensity</u> : Bottom reflectivity. This is a relative value. (Not calibrated).
Min filter info	f32 * N	Minimum two-way travel time to filter point for each beam (minimum depth gate)
Max filter info	f32 * N	Maximum two-way travel time to filter point for each beam (maximum depth gate)

For information on optional data, see APPENDIX A Teledyne PDS Optional Data.

NOTE
<ul style="list-style-type: none"> The compensation flag in the 7006 record is valid for all sonars, it does not compensate the conical intersection, it only correct the range. (conical intersection is required for sonars with projector steering) 7006 record flags if it is compensated for sonar geometry. You cannot do conical intersection correction svc of the 7006 record flagged XYZ compensated since this is already corrected for the tx-rx offset. The correction is required for 7027 record and 7006 flagged XYZ compensation off.

NOTE
Since 7kCenter version 3.4.7.2 of the 7150 branch, the Intensity field of the 7006 record contains quality information and is therefore not useable for backscatter processing.

10.29 7007 – Side Scan Data

Description: This record is produced by the 7k sonar source. It contains the non-calibrated side-scan type data. This record is typically not available in a forward-looking sonar configuration. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section *10.62 7500 – Remote Control* together with *section 11 7k Remote Control Definitions*.

Name	Size	Description
Sonar Id	u64	Sonar serial number
Ping number	u32	Sequential number
Multi-ping sequence	u16	Flag to indicate multi-ping sequence. Always 0 (zero) if not in multi-ping mode; otherwise this represents the sequence number of the ping in the multi-ping sequence.
Beam position	f32	Meters forward from position of beam 0
Control flags	u32	BIT FIELD: <u>Bit 0:</u> Nadir depth record field used. <u>Bit 4:</u> Reserved <u>Bit 1, 2, 3, 5-31:</u> Reserved
S	u32	Samples per side (port/starboard)
Nadir depth	u32	Nadir depth in samples

Name	Size	Description
Reserved	f32 * 7	Reserved
N	u16	Number of beams per side
Current beam number	u16	Beam number of this record's data (0 to N-1)
W	u8	Number of bytes per sample, 1, 2 or 4
Data types	u8	BIT FIELD: <u>Bit 0:</u> Reserved (always 0) <u>Bit 1-7:</u> Reserved

Table 48: 7007 – Record Data

Name	Size	Description
Port beams	W * S	Magnitude/Phase series. First sample represents range 0 meters (total bytes per side).
Starboards beam	W * S	Magnitude/Phase series. First sample represents range 0 meters (total bytes per side).

For information on optional data, see APPENDIX A Teledyne PDS Optional Data.

10.30 7008 – Generic Water Column Data

NOTE
Record 7008 is superseded by 7018 and 7028. It is mutually exclusive. The record is deprecated and will not be supported by Teledyne RESON. It exists for backwards compatibility only.

Description: This record is produced by the 7k sonar source. It contains the sonar beam “I” and “Q” or magnitude and phase data. The 7k sonar source transmits this data for each ping. This record is available by subscription only.

This record is used for snippet output as well. Beams and samples are numbered from 0. First beam to last beam fields are always enumerated from low to high numbers.

The Record Data portion is divided into two distinct parts:

- Beam Descriptors
- Sample Data

Beam Descriptors:

This part of the Record Data section contains each beam descriptor, followed by the beginning and ending sample numbers for that beam. For example:

b0 s1 s100 b2 s1 s100 b3 s1 s100 ...

Where:

b = Beam

s = Sample

Sample Data:

After all of the beams and their corresponding samples have been listed, the sample data will be output.

Sample data will be output in one of two ways:

- All samples for a beam followed by all samples for the next beam (Row Column Flag = 0)
- First sample for each beam followed by next sample for each beam (Row Column Flag = 1).

For example:

1. If the Row Column Flag = 0, the second part of the data would be:

where sd = sample data

2. If the Row Column Flag = 0, the second part of the data would be:

where b_x = sample data for each beam

10.31 7010 – TVG Values

NOTE

This record requires the system to be calibrated. If calibration results are not available, all values are reported as -1.

Description: This record provides the TVG values, one for each sample in the ping. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

10.32 7011 – Image Data

Description: This record is produced by the SeaBat™ 7k sonar 7-P processor series. It contains the sonar image data. The image data is compressed RAW or beamformed magnitude / phase data. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

The image data is arranged in bitmap format. The sample magnitude values set the pixel intensities.

Sampling rate	f32	Sampling frequency in Hz
Pitch	f32	Pitch value at the ping time in radians (see note below)
Roll	f32 * N	Roll value per sample in radians (see note below)
Heading	f32 * N	Heading value per sample in radians (see note below)
Heave	f32 * N	Heave value per sample in meters (see note below)

NOTE

The fields, Pitch, Roll, Heading, and Heave, are present only if corresponding flags are set. The new fields may be added (refer to the record size in the record header for the total size). For sign explanations, see section 2.2 *Sign Conventions*.

10.34 7014 – Adaptive gate

Description: This record is produced by the 7k sonar source. It contains the description of the current adaptive gate settings.

In the 7k sonar source the adaptive search window is used to initialize the adaptive gate, when the user interface sent a new search value the adaptive gate will reinitialized. To display this behavior properly a status flag will be added to indicate if the adaptive search window is active or in passive mode.

Additional information:

In the 7000/7503 record the control flags Bit 19 will be used for this, 0=depth filter active, 1=depth filter passive.

Remote control command 1016 is used to set the adaptive gate window.

The adaptive gate search window needs to be reported in the 7503 record.

10.35 7017 – Detection Data Setup

NOTE

Record 7017 is obsolete. It exists for backwards compatibility only.

Reserved for 7k detection data setup.

Description: This record is produced by the 7k sonar source series. It contains the description of various parameters used in detection computations. The 7k sonar source updates this data for each ping. The record can be subscribed from the 7k sonar source. This record is available by subscription only.

Value zero is highest priority.</p>
Automatic limits minimum sample	f32	Minimum sample number for automatic limits
Automatic limits maximum sample	f32	Maximum sample number for automatic limits
User-defined limits minimum sample	f32	Minimum sample number for user-defined limits
User-defined limits maximum sample	f32	Maximum sample number for user-defined limits
Quality	32 bits	Detection quality, see <i>Table 61</i>
Uncertainty	f32	Detection uncertainty represented as an error normalized to the detection point

The quality field above should be treated as follows, according to the quality type specified in the record data's flags (bits 2-8):

- Table 61: 7017 – Detection Quality

Name	Size	Description
0	u32	Quality is not available/not used
1	u32	BIT FIELD: <u>Bit 0:</u> 1 – Brightness filter passed <u>Bit 1:</u> 1 – Colinearity filter passed
2-31		Reserved for future use

10.36 7018 – Beamformed Data

Description: This record is produced by the 7k sonar source series. It contains the sonar beam magnitude and phase data. The 7k sonar source updates this data for each ping. The record can be subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section *10.62 7500 – Remote Control* together with *section 11 7k Remote Control Definitions*.

This record is available by subscription only.

Beams and samples are numbered from 0. Data is sample followed by beams.

First sample 0 of all beams then sample 1 of all beams etc. The sampling continues until the set range is reached. (Every beam will have the same number of samples)

Data rates:

Equation for no data reduction, beam limits, and all sonar settings:

$$\text{beams} * \text{data format bits} * \text{sample rate} * 10\% \text{ (header overhead)}$$

Example:

$$128 \text{ beams} * 32 \text{ bits (sonar setting 6)} * 34500 \text{ samples/s} * 1.1 = 155.4432 \text{ Mbits/s}$$

Name	Size	Description
Sample 0, Beam 1, Mag	u16	Magnitude for first sample, second beam
...
Sample 0, Beam N-1, Mag	u16	Magnitude for first sample, last beam
Sample 1, Beam 0, Mag	u16	Magnitude for second sample, first beam
...
Sample D-1, Beam N-1, Mag	u16	Magnitude for last sample, last beam
Part 3		
Coherence	u16	Coherence data, following format above. Total size = D x N x 2 bytes
Part 4		
Cross Power	u16	Cross Power data, following format above. Total size = D x N x 2 bytes
Part 5		
Quality Factor	u16	Quality factor data, following format above. Total size = D x N x 2 bytes
Part 6		
Reserved field	u16	Reserved. Total size = D x N x 2 bytes

Part 1 of the Record Data (RD) contains the angle estimate raw values (RV). These are signed 16 bit values. To convert to radians, use the following formula:

$$\text{Angle} = (\text{RV} / 65536) * \text{Elevation coverage}$$

Part 5 of RD contains the quality factor (QF) for each angle estimate normalized such that QF values from min QF to max QF (as defined in the RTH) map to the interval 0 to 65535. After undoing the mapping, the radian vertical angle uncertainty (standard deviation) can be computed as $\sigma = 10^{-\text{QF}}$.

10.38 7021 – Built-In Test Environment Data

Description: This record is produced by the SeaBat™ 7k Sonar 7-P processor. It contains both the Built-In Test Environment (BITE) data and board request data (uplink/downlink). The 7k sonar source updates this record when any of the values have changed and publishes it every second. The record can be manually requested or subscribed to from the 7k sonar source.

For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k Remote Control Definitions.

Table 69: 7023 – Record Type Header

Name	Size	Description
Version string	c8 * 32	ASCII string, max length 31 characters + null

10.41 7027 – Raw Detection Data

Description: This record is produced by the 7k sonar source series. It contains non-compensated detection results. The 7k sonar source updates this record on every ping. This record is available by subscription only.

Refer to APPENDIX F on page 208 for a description of handling the 7027 record.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 70: 7027 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
Ping number	u32	Sequential number
Multiping sequence	u16	Flag to indicate multiping sequence. Always 0 (zero) if not in multiping mode; otherwise this represents the sequence number of the ping in the multiping sequence.
N	u32	Number of detection points
Data field size (S)	u32	Size of detection information block in bytes

Name	Size	Description
Detection algorithm	u8	0 – G1_Simple 1 – G1_BlastFilt 2 – G2 3 – G3 4 – IF1 5 – PS1 (beam detection) 6 – HS1 (beam detection) 7 – HS2 (pseudo beam detection) 8-255 – Reserved for future use
Flags	u32	BIT FIELD: <u>Bit 0-3:</u> Uncertainty method 0 – Not calculated 1 – Rob Hare's method 2 – Ifremer's method 3-15 – Reserved for future use <u>Bit 4:</u> Multi-detection enabled <u>Bit 5: Reserved</u> <u>Bit 6: Has Snippets detection point flag</u> <u>Bit 7-31: Reserved for future use</u>
Sampling rate	f32	Sonar's sampling frequency in Hz
Tx angle	f32	Applied transmitter steering angle, in radians
Applied roll	f32	Roll value (in radians) applied to gates; zero if roll stabilization is ON
Reserved	u32 * 15	Reserved for future use

NOTE

The following data section is repeated for each detection point as defined in RTH. The size of each field is always defined in RTH. If the size of this definition does not match the size specified in the record's header, the user must assume that there is an updated revision of this record and that new fields are added at the end.

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 71: 7027 – Record Data

Name	Size	Description
Beam descriptor	u16	Beam number the detection is taken from
Detection point	f32	Non-corrected fractional sample number with reference to receiver's acoustic center with the zero sample at the transmit time

Name	Size	Description
Rx angle	f32	Beam steering angle with reference to receiver's acoustic center in the sonar reference frame, at the detection point; in radians
Flags	u32	<p>BIT FIELD:</p> <p><u>Bit 0:</u> 1 – Magnitude based detection</p> <p><u>Bit 1:</u> 1 – Phase based detection</p> <p><u>Bit 2-8:</u> Quality type, defines the type of the quality field below</p> <p><u>Bits 9-12:</u> Detection priority number for detections within the same beam (Multi-detect only). Value zero is highest priority.</p> <p><u>Bits 13:</u> Reserved</p> <p><u>Bit 14:</u></p> <ul style="list-style-type: none"> Snippet detection point flag 0 – Detection used in snippet 1 – Not used in snippet <p><u>Bits 15-31:</u> Reserved for future use</p>
Quality	32 bits	Detection quality, see <i>Table 72</i>
Uncertainty	f32	Detection uncertainty represented as an error normalized to the detection point
Signal Strength	f32	Signal strength of detection point
Min limit	f32	Minimum sample number of gate limit
Max limit	f32	Maximum sample number of gate limit

For information on optional data, see APPENDIX A Teledyne PDS Optional Data.

NOTE
Transmit and receive steering angles provided in this record are total steering angles applied. Refer to record <i>7004 – Beam Geometry</i> and/or record <i>7012 – Ping Motion Data</i> in order to isolate steering components. For sign explanations, see section 2.2 <i>Sign Conventions</i> .

The quality field above should be treated as follows, according to the quality type specified in the record data's flags (bits 2-8):

Table 72: 7027 – Detection Quality

Name	Size	Description
0	u32	Quality is not available / not used
1	u32	BIT FIELD: <u>Bit 0:</u> 1 – Brightness filter passed <u>Bit 1:</u> 1 – Colinearity filter passed
2-31		Reserved for future use

10.42 7028 – Snippet Data

Description: This record is produced by the SeaBat™ 7k sonar. It contains the sonar snippet imagery data. The 7k sonar source updates this record on every ping. This record is available by subscription only. It is not available for forward-looking sonar.

For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

For information on optional data, see APPENDIX A Teledyne PDS Optional Data. Beams and samples are numbered from 0. Data is beams followed by samples.

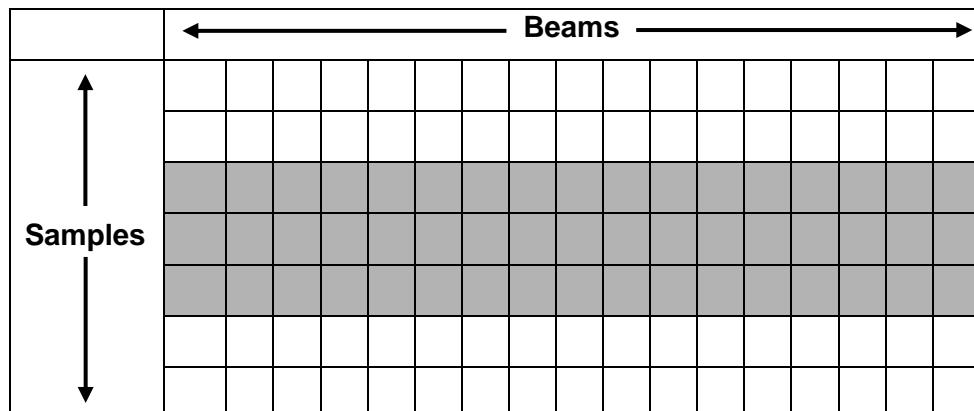

Figure 10-5: Sample Limits – Set Min and Max Sample

Data rates:

Equation for no data reduction, beam limits, and all sonar settings:

$$\text{beams} * \text{data format bits} * \text{sample rate} * 10\% \text{ (header overhead)}$$

Example:

$$\begin{aligned} 128 \text{ beams} * 32 \text{ bits (sonar setting 5)} * 34500 \text{ samples/s} * 1.1 \\ = 155.4432 \text{ Mbits/s} \end{aligned}$$

Equation for sample limits:

$$\text{beams} * \text{ping rate} * \text{samples} * \text{data format bits} * 10\%$$

Example:

$$128 \text{ beams} * 7 \text{ ping/s} * 3000 \text{ samples} * 8 \text{ bits (sonar setting 1)} * 1.1 \\ = 23.6544 \text{ Mbits/s}$$

Position sensor Z	f32	Z offset in meters
Position sensor time delay	u16	Seconds
Water line vertical offset	f32	Vertical offset from reference point to waterline in meters

NOTE
Teledyne PDS Notes: <ul style="list-style-type: none"> The device ID of record 7030 is not as record 7003. Record 7003 is used for all none sonar records in the file (e.g. sensor data). All sonar data exported do have the ID from the original sonar. (7160,20,7111, 7125 etc.) Because of the PDS data source-switching feature, there are no offsets in the 7030 record. (Are all 0.) The data in the 1015 is compensated for the offsets (contains the <u>vessel reference position</u>). So they can be read and applied in automated system which also reads the 1015.

10.45 7031 – Built-In Test Environment Data (Summary)

Description: This record is produced by the SeaBat™ 7k Sonar 7-P processor. It contains a summary of the Built-In Test Environment (BITE) warning, error and fatal level alert items. The 7k sonar source updates this record when any of the values have changed and publishes it every two seconds. The record can be manually requested or subscribed to.

For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 78: 7031 – Record Type Header

Name	Size	Description
Total Items	u16	Total of all <i>warning</i> , <i>error</i> or <i>fatal</i> level BITE status items. If this field is not zero, then the following fields can be examined to determine severity and source of BITE alerts.
Warnings	u16*4	Index 0 = Overall number of warnings. Index 1 = Receiver related warnings. Index 2 = Transmitter related warnings. Index 3 = Other (system) related warnings.
Errors	u16*4	Index 0 = Overall number of errors. Index 1 = Receiver related errors. Index 2 = Transmitter related errors. Index 3 = Other (system) related errors.
Fatals	u16*4	Index 0 = Overall number of fatal status items. Index 1 = Receiver related fatal status items. Index 2 = Transmitter related fatal status items. Index 3 = Other (system) related fatal status items.
RESERVED	u32*2	Zero. Reserved for future use

10.46 7041 – Compressed Beamformed Magnitude Data

Description: This record is produced by the SeaBat™ 7k sonar 7-P processor series. It contains the compressed magnitude sonar beam data. The 7-P processor updates this record for each ping. The record can be subscribed to from the 7-P processor; it is not available by single request. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 *7k Remote Control Definitions*.

NOTE

The 7041 record is deprecated by the new 7042 record. The 7041 record is supported only for 7111 and 7150 systems. All other systems should use the 7042 record.

Data Definition:

Data	S*var	Data series for each sample. (See ‘Data Size’ above)

10.47 7042 - Compressed Water Column Data

Description: This record is produced by the 7k sonar source series. It contains compressed water column data. The 7k sonar source updates this record on every ping. This record is available by subscription only. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

NOTE

Remote command 7500 sub7042 is used to configure this record.

NOTE

See APPENDIX I 7042 Compressed water column data for a description of the compression algorithms used to fill the 7042 record.

The Compressed Water Column record allows for the reduction in record data size (vs. the standard 7018 full magnitude/phase record) via the several possible options listed here. “Downsampling” means that only 1 of N mag/phase samples are kept. Where ‘N’ is the “downsampling factor” value. The “downsampling type” controls how that 1 value is determined. The three choices are:

1. Middle of window:

The 1 sample value kept is the middle one in each “window” (e.g. if N = 5, then we keep sample 3, 8, 13, 18, ...)

2. Peak:

The 1 sample value kept is the largest of each “window” of N samples.

3. Average:

The 1 sample value kept is the average of all N samples in each “window”.

For example, if the “Remove phase data” option and the Downsampling option (with factor 5) are selected, then the resulting Compressed Water Column record will be $1/2 * 1/5 = 1/10$ the size of corresponding 7018 mag+phase Water Column Record.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 81: 7042 - Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number.
Ping number	u32	Sequential number.
Multi-Ping Sequence	u16	Flag to indicate multi-ping sequence. Always 0 (zero) if not in Multi-Ping mode; otherwise this represents the sequence number of the ping in the multi-ping sequence.
Beams (B)	u16	Number of beams.
Samples	u32	Number of samples (nominal, based on range)
Compressed Samples	u32	<p>Number of samples (maximum over all beams if Flags bit 0 set [samples per beam varies]. Otherwise same as Samples(N))</p> <p>When all beams come with the same number of samples 'Compressed Samples' is the same as 'Samples(N)' for each beam in the data section of the record. But if bit 0 is set in the 'Flags' the beams are individually cut based on bottom detection and thus have all different length. 'Compressed Samples' then gives you the maximum number of samples of the beam with the longest range. Same as the largest value of 'Samples(N)' in the data section.</p>
Flags	u32	<p>Bit field:</p> <p>Bit 0 : Use maximum bottom detection point <i>in each beam</i> to limit data. Data is included up to the bottom detection point + 10%. This flag has no effect on systems which do not perform bottom detection.</p> <p>Bit 1 : Include magnitude data only (strip phase)</p> <p>Bit 2 : Convert mag to dB, then compress from 16 bit to 8 bit by truncation of 8 lower bits. Phase compression simply truncates lower (least significant) byte of phase data.</p> <p>Bit 3 : Reserved.</p> <p>Bit 4-7 : Downsampling divisor. Value = (BITS >> 4). Only values 2-16 are valid. This field is ignored if downsampling is not enabled (type = "none").</p> <p>Bit 8-11 : Downsampling type: 0x000 = None 0x100 = Middle value</p>

Name	Size	Description
		0x200 = Peak value 0x300 = Average value Bit 12: 32 Bits data. Bit 13: Compression factor available. Bit 14: Segment numbers available. Bit 15: First sample contains RxDelay value.
First Sample (F)	u32	First sample included for each beam. Normally zero, unless power saving mode “Range Blank” or absolute gate (bit 3) is in effect. See RC 1046 for details. Thus, the samples in each beam data section will run from F to F+N-1. Construction of a correct water column image must take this into account.
Sample Rate	f32	Effective sample rate after downsampling, if specified.
Compression factor	f32	Factor used in magnitude compression.
RESERVED	u32*1	Zero. Reserved for future use

NOTE

If downsampling is used (Flags bit 8-11), then the effective Sample Rate of the data is changed and is given by the sample rate field. To calculate the effective sample rate, the system sample rate (provided in the 7000 record) must be divided by the downsampling divisor factor specified in bits 4-7.

NOTE

The following data section is repeated for each beam (B) as defined in RTH. The size may vary for each beam if bottom detection truncation is in effect (Flags bit 0 is set). **IMPORTANT:** This is “reversed” compared to the data ordering in the standard 7018 Water Column record!

NOTE

When ‘Bit 2’ is set in the flags of the 7042 record, the record contains 8 bit dB values. This should never be combined with ‘Bit 12’ indicating that magnitudes are stored as 32 bit values.

PulseType	u32	<p>BIT FIELD</p> <p>Bit 0-7: 0=CW, 1=FM(chirp), 2-10=reserved</p> <p>11=Barker11, 12=Barer11r, 13=Barker13, 14=Barker13r</p> <p>Bit8-9: 0=linear 1=Parametric</p> <p>Bit 10: Pilot Pulse</p>
Pulse Bandwidth	f32	<p>“+”=up Chirp; “-”=down Chirp in Hz</p> <p>ChirpStartFrequency=Frequenc y-ChirpHeave/2</p>
Tx pulse width	f32	In seconds
Tx beam width cross	f32	Tx -3dB beam width cross , in radians
Tx beam width along	f32	Tx -3dB beam width along , in radians
Tx pulse envelope	u32	<p>0 = rectangular</p> <p>1 = Tukey (rectangular->Hann, variable)</p> <p>2 = Hamming</p> <p>3 = Deconv</p>
Tx pulse envelope parameter	f32	eg: Tukey.Alpha value.
Tx relative Src Level	f32	Tx relative Src Level In %.
RxBandWidth	f32	Rx -3dB beam width
Detection algorithm	u8	<p>0 – G1_Simple</p> <p>1 – G1_BrandFilt</p> <p>2 – G2</p> <p>3 – G3</p> <p>4 – IF1</p> <p>5 – PS1 (beam detection)</p> <p>6 – HS1 (beam detection)</p> <p>7 – HS2 (pseudo beam detection)</p> <p>8-255 – Reserved for future use</p>

	Name	Size	Description
	Flags	u32	<p>BIT FIELD:</p> <p>Bit 0-3: 0 – Not calculated 1 – Rob Hare's method 2 – Ifremer's method 3 – Reserved for future use</p> <p>Bit 4: Multi-detection enabled</p> <p>Bit 5: Beam data is pulse correlated</p> <p>Bit 6: Has Snippets detection point flag. Indicates that Snippet detection point flags will be populated. (Rx flag bit 14)</p> <p>Bit 7-31: Reserved for future use</p>
	Sampling Rate	f32	Sonar's sampling frequency in Hz
	TVG	u8	Applied TVG value
	RxBandWidth	f32	In Hz
nRX	Beam Number	u16	Beam number the detection is taken from
	Used Segment	u16	Number of Segment descriptor.
	Detection point	f32	Non-corrected fractional sample number with reference to receiver's acoustic center with the zero sample at the transmit time
	Rx angle cross	f32	Beam steering angle with reference to receiver's acoustic center in the sonar reference frame, at the detection point; in radians

Name	Size	Description
Flags	u32	<p>BIT FIELD:</p> <p>Bit 0: 1 – Magnitude based detection</p> <p>Bit 1: 1 – Phase based detection</p> <p>Bit 2-8: Quality type, defines the type of the quality field below</p> <p>Bits 9-12: Detection priority number for detections within the same beam (Multi-detect only). Value zero is highest priority.</p> <p>Bit 13: Interferometry between beam point.</p> <p>Bit 14: Snippet detection point flag 0 – Detection used in snippets 1 – Not used in snippets</p> <p>Bits 15-31: Reserved for future use</p>
Quality	32 bits	Detection quality, see <i>Table 7047 – Detection Quality</i>
Uncertainty	f32	Detection uncertainty represented as an error normalized to the detection point
Signal Strength	f32	Signal strength of detection point
SNRatio	f32	S/N ratio in dB

NOTE

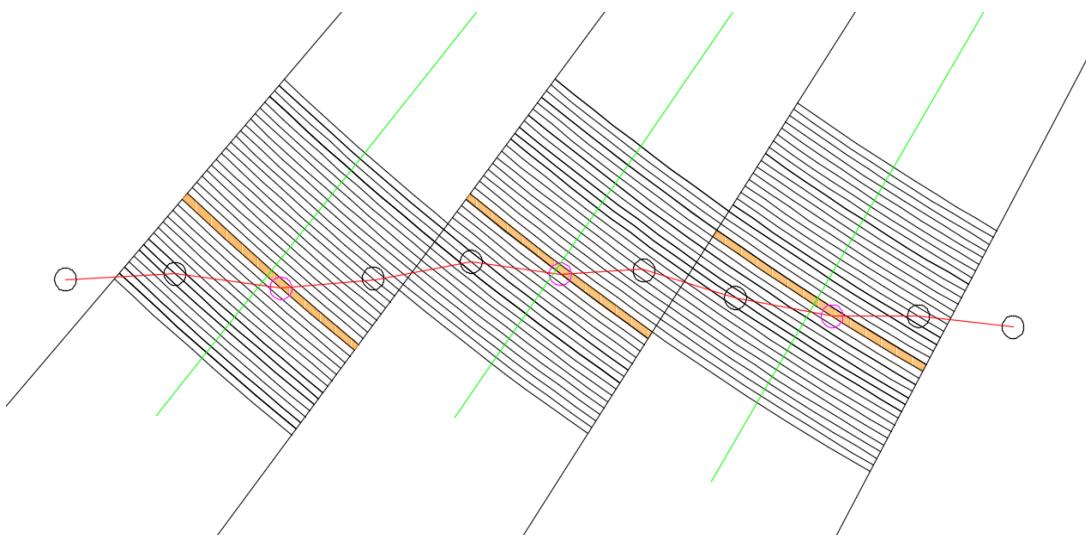

Frequency band is determined by the enumerator. See chapter 6.2

Table 7047 – Detection Quality

Type	Format	Description
0	u32	Quality is not available / Not used
1	u32	<p>Bit field:</p> <p>Bit 0: 1 = Brightness filter passed</p> <p>Bit 1: 1 = Co-linearity filter passed</p>
3-31		Reserved for future use

**NOTE**

Drawing to clarify use of detection point and snippets bottom detection sample.

Green line is centre beam.

Black circle is bottom detection point.

Purple circle is bottom detection point nearest to centre beam.

Black lines are snippets samples.

Orange sample is Bottom detection sample for snippets.

NOTE

HydroSweep has especially in the outer beams (equal-angle water column data) multiple detections (equal-distance) with different angles and does not have only one bottom detection per beam.

HydroSweep does not produce multiple detection for the same Rx angle and therefore has no Multi-detect function. Therefore you'll only find zeros for the "detection priority numbers" (Flags) in the 7047 from HydroSweep. HydroSweep produces multiple bottom (bathy) detection points with different across angles from the same beam-formed reception beam by advanced split beam processing. They all have to be used by default for the bathy processing. Only if the "detection priority number" would be nonzero the detection can be ignored or treated optional for advanced bathy post-processing. The beam number in 7047 points to the reception beamformed data (water column data) where the detection was taken from and has no meaning for the HydroSweep bathy processing. Actually, with no Multi-detect in HydroSweep it could be fully ignored.

10.49 7048 – Calibrated Beam Data

NOTE
This record contains non-calibrated beam magnitude, if calibration is available but not run. (See Error flag in <i>Table 85: 7048 – Record Type Header</i>).

Description: This record is produced by the SeaBat™ 7k sonar series. It contains the calibrated sonar beam magnitude. The 7k sonar source updates this record for each ping.

Beams and samples are numbered from 0. Data is sample followed by beams.

Additional SeaBat™ Data Settings (Data Reduction).

Both beam limits and SeaBat™ format types can be combined.

10.50 7050 – System Events

Description: This record is produced by the SeaBat™ 7k sonar series. It contains the 7k sonar source system events. The 7k sonar source updates this record when any event is added or removed in the system. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

Table 96: 7055 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
Calibration status	u16	0 – Calibration is not available 1 – Calibration was not done 8 – Calibration is in progress 16 – Calibration completed >127 – Calibration failed

Name	Size	Description
Percent complete	u16	If status is 8 (in progress) this field indicates percentage completed. If calibration status is 16 (completed) this field indicates the following. 0 – Results of previous calibration used without validation 1-99 – Results of previous calibration validated and used 100 – Full calibration performed
Calibration time	u8 * 10	Completion time of most recent calibration (zero if none). TIME_7K format (UTC). If calibration status is 1 (not done), calibration time other than zero indicates that previous calibration results are available but not validated.
Status message	c8 * 800	Status message text string (null terminated)
Sub status	u32	Status details 0 – Ok 1 – No license file 2 – License file corrupt 3 – Invalid version 10 – Failed – noise 11 – Failed – ceramics bad 12 – Failed – magnitude tolerance 13 – Failed – phase tolerance
<i>Fields below apply only for FP2+ multi-frequency systems</i>		
Calibration system	u8	Bitfield indicating which system(s) are being calibrated <u>Bit 0:</u> enum <u>Bit 1:</u> enum Etc
Calibration system done	u8	Bitfield indicating which ones are already done
Current calibration system	u8	Enum of system being calibrated
Start-up calibration	u8	Non zero if start-up calibration is in progress
Status	u16	Final status of each system calibrated
Reserved	u32 * 2	Reserved

10.56 7057 – Calibrated Side-Scan Data

Description: This record is produced by the 7k sonar source. It contains the calibrated side-scan sonar data. This record is typically not available in a forward-looking sonar configuration. This record is not available for subscription, if calibration is not available for the system. This record contains non-calibrated side-scan data, if calibration is available but not run.

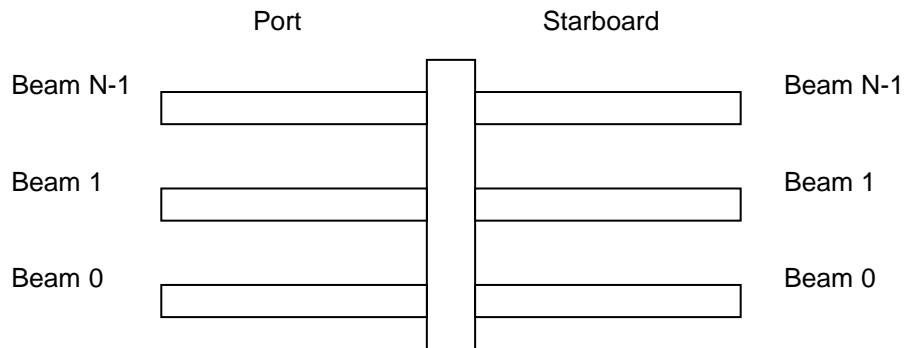

Figure 10-7: Beam Port and Starboard Numbering

Data Definition:

Table 97: 7057 – Record Type Header

Name	Size	Description
Sonar Id	u64	Sonar serial number
Ping number	u32	Sequential number
Multi-ping sequence	u16	Flag to indicate multi-ping sequence. Always 0 (zero) if not in multi-ping mode; otherwise this represents the sequence number of the ping in the multi-ping sequence.
Beam position	f32	Meters forward from position of beam 0
Reserved	u32	Controls BIT FIELD: <u>Bit 0-31: Reserved</u>
S	u32	Samples per side (port/starboard)
Reserved	f32 * 8	Reserved
N	u16	Number of beams per side
Current beam number	u16	Beam number of this record's data (0 to N-1)
W	u8	Number of bytes per sample 4 – Single precision (u32)
Data types	u8	BIT FIELD: <u>Bit 0: Reserved (always 0)</u> <u>Bit 1-7: Reserved</u>

Name	Size	Description
Error flag	u8	If set, record contains original non-calibrated beamformed data. Flag itself will indicate an error. 0 – OK 1 – No calibration 2 – TVG read error (R7010) 3 – CTD not available (R1010) 4 – Invalid or not available geometry (R7004) 5 – Invalid sonar specifications (XML) 6 – Bottom detection failed 7 – No power (Power is set to zero) 8 – No gain (Gain is too low) 128-254 – Reserved for internal errors 255 – System cannot be calibrated (c7k file missing)

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 98: 7057 – Record Data

Name	Size	Description
Port beams	W * S	Magnitude/Phase series. First sample represents range 0 meters (total bytes per side).
Starboards beam	W * S	Magnitude/Phase series. First sample represents range 0 meters (total bytes per side).
Port beams number	S * u16	Indicates the beam number corresponding value was taken from
Starboards beams number	S * u16	Indicates the beam number corresponding value was taken from

NOTE

Calibrated side-scan data is returned as floating point values, either single (W = 4 bytes) or double (W = 8 bytes) precision.

For information on optional data, see APPENDIX A Teledyne PDS Optional Data.

10.57 7058 – Snippet Backscattering Strength

NOTE

Normalized backscatter license must be enabled in order to receive this record.

Description: This record is produced by the SeaBat™ 7k sonar. This record is available by subscription only, and is only available if normalized backscatter is licensed on the system. It contains snippet data of the backscattering strengths. The backscattering strengths have been obtained from snippet intensity data which have been compensated for sonar system parameters, propagation losses and geometric footprint as described in the record. The 7k sonar source updates this record on every ping. Sonar system compensation can be based upon generic performance parameters for each component, or specific calibration parameters for individual units, as specified in the record.

Beams and samples are numbered from 0. Data is beams followed by samples.

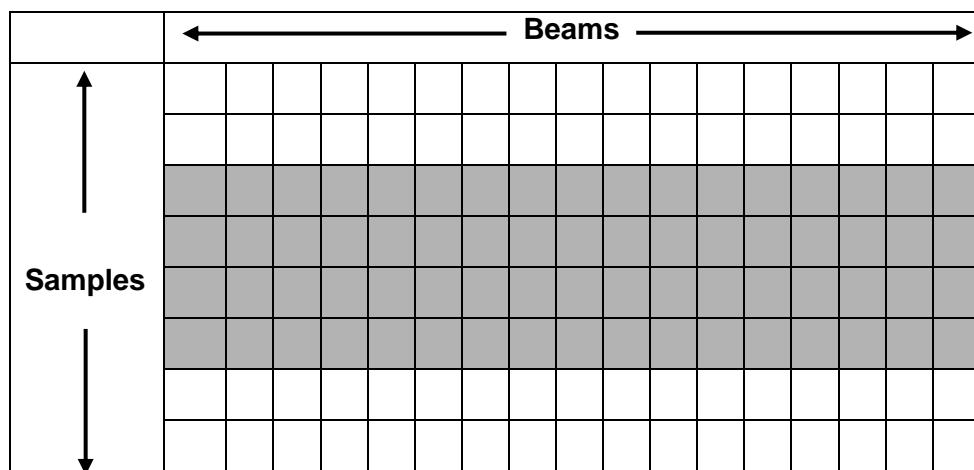

Figure 10-8: Sample Limits – Set in dB Around Bottom Detection Point

Table 103: 7200 – Record Data

Name	Size	Description
Device identifier 0	u32	Identifier for record type of embedded data
System enumerator 0	u16	Identifier for the device enumerator
...
Device identifier N-1	u32	Identifier for record type of embedded data
System enumerator N-1	u16	Identifier for the device enumerator

This record may have optional data that contains information about the file catalog (7300 record) at the end of the log file. The optional data identifier (in the record frame) will be 7300.

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 104: 7200 – Optiona Data

Name	Size	Description
Size	u32	Size of the file catalog record

Offset	u64	File offset of the file catalog record
--------	-----	--

10.60 7300 – File Catalog Record

Description: 7k file catalog record, placed at the end of log files.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 105: 7300 – Record Type Header

Name	Size	Description
Size	u32	Size of this record type header
Version	u16	1
Number of records	u32	Number of records in the file
Reserved	u32	Reserved

The file catalog contains one entry for each record in the log file, including the 7200 file header record, but excluding the 7300 file catalog record. The information corresponds to the record frame, plus the offset in the file.

Name	Size	Description
Size	u32	Record size in bytes
Offset	u64	File offset
Record type	u16	Record type identifier
Device identifier	u16	Device identifier
System enumerator	u16	System enumerator
7KTIME	u8 * 10	Time
Record count	u32	Total records in fragmented data record set
Reserved	u16 * 8	Reserved

10.61 7400 – Time Message

Description: This record is used to time-sync the 7k sonar source. The leap second offset field can be used to flag for leap second inserts ahead of time. The current time is shown in the 7KTIME field of the DRF.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 107: 7400 – Record Type Header

Name	Size	Description
Leap second offset	i8	-1, 0 or +1 second for midnight 31 Dec
Pulse flag	u8	0 – Message is not associated with hardware pulse 1 – Message preceding hardware pulse 2 – Message following hardware pulse
Port identifier	u16	Port number identifier for pulse
Reserved	u32	Reserved
Reserved	u64	Reserved

NOTE

SeaBat™ 7k Time Records have a reserved number range from 7400 through 7499.

The record can contain optional data. For information on optional data, see APPENDIX A Teledyne PDS Optional Data

10.62 7500 – Remote Control

Description: This record is used to remotely control SeaBat™ 7k sonar series. It contains the 7-P processor remote control commands. A remote control command is either acknowledged (record 7501) or not acknowledged (record 7502). The record can be subscribed to from the 7k sonar source. For details about subscribing to records, see *section 10 Record Type Definitions*. All remote control commands shall be sent to TCP or UDP port 7000 on the 7-P processor.

NOTE

If a 7500 command is sent which requires no argument, an empty byte still needs to be packed into the command data.

Tracking number	u64*2	Unique number in record 7500
Error code	u32	See APPENDIX D 7k Error Codes for details

10.65 7503 – Remote Control Sonar Settings

Description: This record is produced by the SeaBat™ 7k Sonar. It contains the remote control sonar settings. The 7k sonar source updates this record for each ping. For multi-ping only one record is produced for the whole sequence. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section *10.62 7500 – Remote Control* together with *section 11 7k Remote Control Definitions*.

Bottom detection filter info	f32	Max range (if range filter active)
Bottom detection filter info	f32	Min depth (if depth filter active)
Bottom detection filter info	f32	Max depth (if depth filter active)
Absorption	f32	Absorption in dB/km
Sound velocity	f32	Sound velocity in m/s
Spreading	f32	Spreading loss in dB
Reserved	u8	Reserved
Automatic filter window	u8	Automatic filter window size in percent of the depth
Tx array position offset X	f32	Offset of the transmitter array in m, relative to the receiver array on the X axis, positive value is to the right, if the receiver faces forward Refer to chapter 2.4.

Name	Size	Description
Tx array position offset Y	f32	Offset of the transmitter array in m, relative to the receiver array on the Y axis, positive value is forward, if the receiver faces forward Refer to chapter 2.4
Tx array position offset Z	f32	Offset of the transmitter array in m, relative to the receiver array on the Z axis, positive value is up, if the receiver faces forward Refer to chapter 2.4
Head Tilt X	f32	Radians
Head Tilt Y	f32	Radians
Head Tilt Z	f32	Radians. Typically zero.
Ping state	u32	Ping state: 0 – Pinging disabled 1 – Pinging enabled 2 – External trigger
Beam spacing mode	u16	1 – Equiangle 2 – Equidistant 3 – Flex 4 – Intermediate
7k sonar source mode	u16	0 –Normal 1 – Autopilot 2 – Calibration (IQ) 3+ – Reserved
Adaptive gate bottom filter information	f32	Min depth (if Adaptive Gate depth filter is active)
Adaptive gate bottom filter information	f32	Max depth (if Adaptive Gate depth filter is active)
Trigger out width	f64	Valid if control bit 24 is set
Trigger out offset	f64	Valid if control bit 24 is set
81xx series projector Selection	u16	0 – Stick 1 – Main Array 2 – Extended Range 3+ – Reserved
Reserved	u32 * 2	Reserved
81xx series alternate gain	f32	Gain in dB for Method not selected in Control flags bits 10 and 11
Vernier filter	u8	Vernier filter settings
Reserved	u8	Reserved

Name	Size	Description
Custom beams	u16	Custom number of beams
Coverage angle	f32	Coverage angle in radians
Coverage mode	u8	0 – Reduce Spacing 1 – Reduce Beams
Quality filter flags	u8	BIT FIELD: <u>Bit 0:</u> 0 – Quality filter disabled 1 – Quality filter enabled <u>Bit 1-7: Reserved, must be zero</u>
Horizontal receiver beam steering angle	f32	Steering angle in radians (positive to starboard)
FlexMode sector coverage	f32	Coverage sector in radians
FlexMode sector steering	f32	Steering angle in radians (positive to starboard)
Constant spacing	f32	Constant beam spacing on the seafloor in meters.
Beam mode selection	u16	Zero based index number corresponding with the available beam modes in the sonar XML
Depth gate tilt	f32	Angle in radians (positive to starboard)
Applied frequency	f32	Transmit frequency for UI slider. Will be different from center frequency in full-rate dual-head.
Reserved	u32	Reserved

10.66 7504 – Common System Settings

Description: This record is produced by the SeaBat™ 7k sonar series. It contains additional sonar settings. The 7k sonar source updates this record on change only. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k Remote Control Definitions.

Name	Size	Description
SVPFilter	u8	SVP Filter type 1 – No Filter 2 – Light Filter 3 – Normal Filter 4 – SVP70 Wizard
SV manual override	u8	Deprecated, use Sensor Manual Override flags field
Active enumerator	u16	Enumerator of pinging system
Active device ID	u32	Device ID of pinging system
System mode	u32	0 – Manual (normal) mode 1 – AutoPilot mode 2 – I&Q (normalization) mode 3 – Playback mode 4+ – Reserved
Master Slave Mode	u32	0 – Normal 1 – Master full (full rate) 2 – Slave 3 – Master half. Separate enumeration for $\frac{1}{2}$ rate (“ping-pong”) mode vs. full rate.
Tracker flags	u32	<u>Bit 0</u> : Enable range control <u>Bit 1</u> : Enable power & gain control <u>Bit 2</u> : Enable pulse length control <u>Bit 3</u> : Enable coverage angle control <u>Bit 4</u> : Use fixed swath width <u>Bit 5</u> : Set maximum coverage angle
Tracker swath width	f32	Tracker swath width in meters
Multi-Detect Enable	u16	Zero = Multi-detect OFF. Non-zero = Multi-detect ON.

Name	Size	Description
Multi-Detect Object Size	u16	<p>Range of 1 to 100.</p> <p>Controls the sensitivity of the algorithm to Object Size.</p> <p>This is a unit-less quantity.</p> <p>Note: Increasing this parameter results in more detections on smaller objects.</p> <p>Decreasing this parameter results in fewer detections and only on larger objects.</p>
Multi-Detect Sensitivity	u16	<p>Range of 1 to 100.</p> <p>Controls the sensitivity of the algorithm to Amplitude.</p> <p>This is a unit-less quantity.</p> <p>Note: Increasing this parameter causes more objects to be detected.</p>
Multi-Detect Max Detections	u16	<p>Range of 1 to 5.</p> <p>Limits the number of detections produced per beam.</p> <p>The maximum number of detections per beam is five.</p> <p>Note: If there are fewer clusters which are over the sensitivity threshold than the selected number of detections, only the number of valid detections shall be produced, i.e. detections will not be generated from clusters below the sensitivity threshold.</p>
Multi-Detect Reserved	u16 * 2	Reserved, set to zero
Slave IP Address	u8 * 4	<p>Slave IP V4 Address (big endian data order).</p> <p>Only valid for record revision number 1 or greater.</p>
Snippet Control Flags	u32	<p>BIT FIELD: (1 – Enabled)</p> <p>Bit 0: Use automatic snippet window</p> <p>Bit 1: Include at least samples around bottom detection (min. window size is valid)</p> <p>Bit 2: Include at most samples around bottom detection (max. window size is valid)</p> <p>Bit 3-31: Reserved</p>

Name	Size	Description
Snippet Control Min. Window	u32	Used as Minimum Window Size when bit 0 is set (automatic window) AND bit 1 is set. Used as Fixed Window Size when flags bit 0 is NOT set (fixed window).
Snippet Control Max. Window	u32	Max snippet window. Used when flags bit 2 is set.
Full Rate Dual Head Flag	u32	1 – Full-rate dual head enabled
Delay multiplier	f32	Master delay multiplier
Power Saving Mode	u8	0 : None . No power saving enabled at all. Can be used as reference. 1 : Normal . Components save power when possible. No effect on operation. 2 : Range Blank . Normal saving + “real” samples are not output from RX controller until X range is reached. X is controlled by the <u>Flags</u> and <u>Range Blank Control</u> fields. 3 : Sleep . Components will be put in sleep mode. Sleep mode has 0 to 50ms recovery time. All settings will be retained. NO DATA is produced in sleep mode. 4 : Hibernate . Components will be put in hibernate mode. Hibernate mode has 0 to 10 second recovery time. All settings will be retained. NO DATA is produced in hibernate mode.
Flags	u8	Bits 0 – 7 : Reserved, zero.
Range Blank Control	u16	Used only for power saving mode 2 (“ <i>Range Blank</i> ” mode). Controls size of range blanking interval. Ping data during this time interval will be zero. Only affects receiver component. This value gives range blanking interval as a percent of range scale (0 – 100). The number of samples blanked will change with range settings in this case.
Startup Normalization	u8	Non-zero to enable normalization at startup.
Restore Ping Rate	u8	Non-zero to restore ping rate to previous setting (which was in effect when system was last shut down).

Name	Size	Description
Restore Power	u8	Non-zero to restore power to previous setting. Otherwise system starts with power OFF.
SV Interlock	u8	Non-zero to enable Sound Velocity Interlock safety feature (for system with integrated SV probe only).
Ignore PPS Errors	u8	Non-zero to suppress error messages due to PPS signal errors. Proper functioning of the PPS signal is normally required for accurate data time-stamping in bathymetry systems.
Reserved	u8*15	Reserved. Zero.
Compressed Water Column (7042) record control flags	u32	Bit field: Bit 0 : Use maximum bottom detection point <i>in each beam</i> to limit data. Data is included up to the bottom detection point + 10%. This flag has no effect on systems which do not perform bottom detection. Bit 1 : Include magnitude data only (strip phase). Bit 2 : Convert mag to dB, then compress from 16 bit to 8 bit. Phase compression simply truncates lower (least significant) byte of phase data. Bits 31 – 3 : Reserved.
Deck Mode	u8	Deck mode. Non zero: Sonar is in deck mode.
Reserved	u8	Reserved. Filled with 0xFB.
Power mode (of control Center PC) flags	u8	Bit field: Bit 0: Power mode supported by Control Center computer. Bit 1: Power mode status CPU throttled. Bit 2: Power mode status AC.
Power mode max	u8	Percentage on which the CPU is throttled between 0-100%.
Water Temperature	f32	Water Temperature (°C).

Name	Size	Description
Sensor Manual Override	u8	Bit field: Bit 0: Manual override of sound velocity in effect. Bit 1: Manual override of temperature in effect.
Sensor Data Flags	u8	Bit field: Bit 0: Sound velocity sensor data stream detected. Bit 1: Temperature sensor data stream detected. <i>(Persistent – bit set if sensor data stream was ever seen)</i>
Sensor Active	u8	Bit field: Bit 0: Sound velocity sensor data stream active. Bit 1: Temperature sensor data stream active. <i>(Volatile – bit set only if sensor input is active; timeout period = ~15 sec.)</i>
Reserved	u8	Reserved. Filled with 0xFB.
Tracker max coverage	f32	In radians.
Duty cycle method	u16	0 – Ping rate. 1 – Power level. Bits 3 - 15 Reserved.
Reserved	u16	Reserved. Filled with 0xFB.
Reserved	u32 * 99	Reserved Filled with 0xFB.

10.67 7510 – SV Filtering

Description: This record is generated every time a surface sound velocity value is received by the 7k sonar source either via record 7610 (see section 10.69 7610 – Sound Velocity) or remote control command 7610 – Manual Sound Velocity (see section 11.82 7610 – Manual Sound Velocity). A filtered sound velocity will be generated. If received via record 7610 and dispatcher is set for immediate broadcast, record 7510 will be broadcast immediately upon receiving record 7610, otherwise (throttled broadcast or receipt of remote control command 7610) it will be broadcast on dispatcher's external records update.

For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 114: 7510 – Record Type Header

Name	Size	Description
Sensor SV	f32	Surface sound velocity reported by sensor If 'Filter' value is either 0 (no value) or 128 (manual), Sensor SV is set to 0 (zero).
Filtered SV	f32	Filtered sound velocity value used

Name	Size	Description
Filter	u8	0 – No value; no sound velocity value was received by the 7k sonar source 1 – Transparent; no filtering 2 – Light filter 3 – Normal filter 4 – SVP70 Wizard 5-127 – Reserved 128 – Manual input

NOTE
Record 7510 is <u>not</u> generated if the surface sound velocity value is received via record 7610 while the 7k sonar source is in manual overwrite mode.

NOTE
SV Filter is now reset every time a manual value is received via the remote control command 7610. Manual values are never filtered.

10.68 7511 – System Lock Status

Description: This record informs the clients about SeaBat™ 7k being used exclusively by single client. No other client will be able to change any parameters of the system while it is locked. The remote control commands will be not acknowledged with the error code 0x700B (Remote Command Denied). The 7k sonar source updates and publishes this record when the status has changed. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 115: 7511 – Record Type Header

Name	Size	Description
System lock	u16	0 – System is not locked 1 – System is locked
Client IP	u32	IP Address of the client that has exclusive control of the system. 127.0.0.1 (little endian) is reported for local clients (those that are running on the same host as 7k sonar source) regardless of the type of the connection (TCP or Shared Memory). This field is not valid if system is not locked.
Reserved	u32 * 8	Reserved for future use

NOTE
This record is unidirectional. See remote command 1503 in section 11 7k Remote Control Definitions for how to gain exclusive control of the system.

10.69 7610 – Sound Velocity

Description: This record can be used to set the SeaBat™ 7k sonar series systems current sound velocity value. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – *Remote Control* together with section 11 7k *Remote Control Definitions*.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 116: 7610 – Record Type Header

Name	Size	Description
Sound velocity	f32	In meters/second
Temperature	f32	Kelvin (optional)
Pressure	f32	Pascal (optional)

NOTE
The Pressure field is for information only. It is not used in the 7k sonar source. The 7k sonar source simply passes the record along to subscribers and raw data recording with no source code changes. The field is not present with a version of the IO Module older than V4.0.0.8. When the value is zero it is not valid.

NOTE
If filtering is enabled in record 7510 (see section 10.67 7510 – <i>SV Filtering</i>), record 7610 will contain filtered values used by 7k sonar source when broadcasted by 7k sonar source, except when in manual overwrite mode.

NOTE
Record 7610 is updated for single request, but not broadcast when manual value is received via remote control command 7610. Record 7610 is generated every time surface sound velocity value is received via record 7610 even if 7k sonar source is in manual overwrite mode and the value was ignored. In this case, returned sound velocity value will be unfiltered.

10.70 7611 – Absorption Loss

Description: This record can be used to set the SeaBat™ 7k sonar series systems current absorption loss value. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 117: 7611 – Record Type Header

Name	Size	Description
Absorption loss	f32	In dB/km

10.71 7612 – Spreading Loss

Description: This record can be used to set the SeaBat™ 7k sonar series systems current spreading loss value. This coefficient value is used in conjunction with the absorption loss value to re-compute the TVG curve that will be applied to amplify the returned signal. The record can be manually requested or subscribed to from the 7k sonar source. For details about requesting and subscribing to records, see section 10.62 7500 – Remote Control together with section 11 7k Remote Control Definitions.

Spreading loss	f32	In dB (0.0-60.0)

11 7K REMOTE CONTROL DEFINITIONS

11.1 Overview

This is a detailed discussion of the Record Data section of the 7500 record. The SeaBat™ 7k series system supports all commands or a subset of the below commands.

Table 119: 7k Remote Control Definitions

Identifier	Description	Possible Return Records
1000	Shutdown	7501, 7502
1001	Reboot	7501, 7502
1002	Calibrate	7501, 7502
1003	Range	7501, 7502
1004	Max ping rate	7501, 7502
1005	Transmit power	7501, 7502
1006	Pulse length	7501, 7502
1007	Pulse type	7501, 7502
1008	Receiver gain	7501, 7502
1009	Bottom detection mask	7501, 7502
1010	Bottom detection filter information	7501, 7502
1011	Projector selection	7501, 7502
1012	Reserved for projector beam stabilization	
1013	Reserved for receive beam stabilization	
1014	System mode	
1015	Reserved for hydrophone selection	
1016	Bottom detection adaptive gate window and filters	
1017	Receiver gain type	
1019	Vernier Processing Parameters	
1020	Transmit pulse envelope identifier	
1021	Projector beam steering	7501, 7502
1022	Projector beam widths	7501, 7502
1023	Reserved for projector beam focal point	
1024	Reserved for projector beam weighting	
1025	Reserved for receiver beam weighting	
1026	Reserved for system center frequency	7501, 7502
1027	Transmit frequencies for chirps	7501, 7502
1028	Head tilt	

Identifier	Description	Possible Return Records
1029	Projector position relative to receiver	7501, 7502
1032	Reserved for beam spacing mode	
1033	Motion compensation	
1034	Match filter parameters	
1035	Coverage sector	
1037	Motion sensor configuration	
1038	FlexMode parameters	
1039	Beam mode selection	
1040	Sample rate parameters	
1050	Single record request	7503, 7001, 7002, 7005, 7050, 7051, 7052, 7600, 7611, 7612
1051	Record subscription	7503, 7000, 7001, 7002, 7004, 7006, 7007, 7008, 7011, 7038, 7050, 7051, 7052, 7500, 7610, 7611, 7612
1052	End all subscriptions	7501, 7502
1053	Third party data connection	7501, 7502
1054	Delete third party data connection	7501, 7502
1055	Data feed, range of records	7501, 7502, and all subscribed records
1056	Unsubscribe records on data feed	7501, 7502
1099	Stop 7k sonar source	7501, 7502
1100	Start pinging	7501, 7502
1101	Stop pinging	7501, 7502
1102	Load factory parameters	7501, 7502
1103	Snippet control	7501, 7502
1106	Reserved for sonar sequencer control	
1107	Single ping request	7501, 7502
1108	Reserved for load factory parameters, specific sonar	
1109	System health verification	7501, 7502
1111	Multi-ping control enable	
1112	Reserved for multi-ping projector focusing	
1113	Calibrated snippet control	
1114	External trigger	
1115	Trigger out	

Identifier	Description	Possible Return Records
1116	PPS edge control	
1117	Reserved for Quality filter settings	
1118	Snippet control	
1138	Element limit control	
1200	Start recording	7501, 7502
1201	Stop recording/playback	7501, 7502
1202	Start playback	7501, 7502
1203	Reserved for data storage delete	
1204	Data storage status request	
1205	Reserved for get catalog	7502
1206	Set warning thresholds	7501, 7502
1207	Set recording directory	7501, 7502
1209	Set filtering	7501
1211	7k Logging settings	7501, 7502
1300-1305	Reserved	
1400	Autopilot table update	
1401	Autopilot algorithm parameters update (not described in the documentation)	7501, 7502
1503	Reserved for system lock	
1509	System health check (not described in the documentation)	7501, 7502
1600	Custom recording control	7501, 7502
1601	Custom playback control	7501, 7502
1602	Custom sensors	7501, 7502
1603	Stacking	7501, 7502
1604	Serial ports	7501, 7502
1605	RRIO addresses	7501, 7502
1606	Custom recording quick info	7501, 7502
1607	Head tilt angle	7501, 7502
1608	Deck mode	7501, 7502
7041	R7041 setup	
7042	Compressed Water column record options	7501, 7502
7610	Manual sound velocity	

11.2 1000 – Shutdown

Description: Software and firmware halt followed by power shutdown to dry and wet hardware.

This command has no parameters.

11.3 1001 – Reboot

Software and firmware reset.

This command has no parameters.

11.4 1002 – Sonar Source Calibration Control

Description: Initiate system calibration, cancel calibration, control various aspects of calibration process, etc.. Record 7055 (7K Calibration Status Information) will indicate the ongoing calibration status and Record 7005 will be available when calibration is complete.

Table 120: 7500 Record Data – Command 1002

Name	Size	Description
Calibration Command	u16	0 – Start calibration process 1 – Cancel any calibration that's in progress 2 – Use results of last calibration (ignored if no calibration has been done) 3 – Verify existing calibration 4 – Revert to previous 5 – Clear to "not calibrated" state 6-10 – Reserved / internal 11 – Start calibration (Cal-tone OFF) 12 – Set Cal-tone frequency. <i>Optional Data</i> is 32 bit float specifying frequency in Hz. 13 – Manual Cal-tone control (on/off). <i>Optional Data</i> is 16 bit Boolean flag (0 = OFF, non-zero = ON) 14 – EM7218 amplitude and waveform control ('D' command) 15 – Manual Tx shading control (on/off). <i>Optional Data</i> is 16 bit Boolean flag (0 = OFF, non-zero = ON)
Optional Data	variable	Depends on Calibration Commands

11.5 1003 – Range

Description: System Range Setting

Table 121: 7500 Record Data – Command 1003

Name	Size	Description
Range	f32	Range setting in meters

11.6 1004 – Max Ping Rate

Description: Max ping setting

Table 122: 7500 Record Data – Command 1004

Name	Size	Description
Max ping rate	f32	Max ping rate setting in pings per second

11.7 1005 – Transmit Power

Description: System transmit power setting

Table 123: 7500 Record Data – Command 1005

Name	Size	Description
Transmit power	f32	Transmit power in dB re 1µPa@1m

11.8 1006 – Pulse Length

Description: System transmitter pulse length setting

Table 124: 7500 Record Data – Command 1006

Name	Size	Description
Transmit pulse width	f32	Transmit pulse length in seconds

11.9 1007 – Pulse Type

Description: System transmitter pulse type.

This command is only available for selected systems.

Table 125: 7500 Record Data – Command 1007

Name	Size	Description
Transmit pulse type	u32	0 – CW 1 – Linear chirp

11.10 1008 – Receiver Gain

Description: System receiver gain.

Table 126: 7500 Record Data – Command 1008

Name	Size	Description
Receiver gain	f32	Gain selection in dB

11.11 1009 – Bottom Detection Mask

Description: System bottom detection mask.

Table 127: 7500 Record Data – Command 1009

Name	Size	Description
Bottom detection flag	u32	<p>BIT FIELD:</p> <p><u>Bit 0-3:</u> Reserved</p> <p><u>Bit 4-7:</u> Reserved for bottom detection method</p> <p><u>Bit 8:</u> Range filter</p> <ul style="list-style-type: none"> 0 – Disabled 1 – Enabled <p><u>Bit 9:</u> Depth filter</p> <ul style="list-style-type: none"> 0 – Disabled 1 – Enabled <p><u>Bit 10:</u> Adaptive gate</p> <ul style="list-style-type: none"> 0 – Disabled 1 – Enabled <p><u>Bit 11:</u> Adaptive gate depth filter</p> <ul style="list-style-type: none"> 0 – Disabled 1 – Enabled <p><u>Bit 12:</u> Adaptive gate depth filter fixed</p> <ul style="list-style-type: none"> 0 – Follow seafloor 1 – Fix depth <p><u>Bit 13:</u> Depth filter follows seafloor</p> <ul style="list-style-type: none"> 0 – Fix depth 1 – Follow seafloor <p><u>Bit 14-31:</u> Reserved</p>

11.12 1010 – Bottom Detection Filter Information

Description: System bottom detection filter information. The minimum and maximum must differ by at least 2 meters.

Table 128: 7500 Record Data – Command 1010

Name	Size	Description
Min range	f32	In meters
Max range	f32	In meters
Min depth	f32	In meters
Max depth	f32	In meters
Depth gate tilt	f32	Angle in radians (positive to starboard)

11.13 1011 – Projector / Frequency Selection

Description: Selects an active projector (8k systems) or active frequency (7k systems). This command does not apply to T-Series sonars with variable CW capability.

NOTE
8k systems only: If any other transmitter is pinging (even if Max Ping Rate is zero), this command will fail. 1101 – Stop Pinging – should be issued prior to issuing this command. Reselecting current transmitter always succeeds regardless of pinging state.

Table 129: 7500 Record Data – Command 1011

Name	Size	Description
Command	u32	<p><u>8K wet ends – projector selection:</u></p> <p>0 – Stick 1 – Main array 2 – Extended range 3+ – Reserved</p> <p>If set to -1 (0xffff) the projector selection will be forced, by issuing stop pinging command to all other projectors</p> <p><u>7k systems:</u> For multi-frequency systems where each XML configuration file defines operating parameters for one frequency, selects the active frequency configuration by system enumerator value.</p> <p>0 – Enumerator 0 (e.g. 7125 400kHz) 1 – Enumerator 1 (e.g. 7125 200kHz). 2 – Enumerator 2 (e.g. 7131 635kHz) 3 – Enumerator 3 4+ - Reserved</p>

11.14 1014 – System Mode

Description: Mode of the system: normal, autopilot or normalization.

Table 130: 7500 Record Data – Command 1014

Name	Size	Description
System mode	u16	<p>0 – Manual (normal) mode 1 – AutoPilot mode/Tracker 2 – I&Q (normalization) mode</p>
Auto-pilot flags	u16	<p>Bit 0 – 14: Reserved Bit 15: Use legacy auto-pilot (if supported) instead of Tracker</p>

11.15 1016 – Bottom Detection Adaptive Gate Window and Filters

Description: Controls the bottom detection adaptive gate operation. The nadir search minimum and maximum values are used only if the Adaptive Gate Depth Filter option is enabled (See section 11.11 1009 – Bottom Detection Mask). The minimum and maximum must differ by at least 2 meters.

Table 131: 7500 Record Data – Command 1016

Name	Size	Description
Window size	i32	Bottom detection gate size as a percentage of the approximate nadir depth. Valid range is 1-100.
Search minimum	f32	Minimum depth for initial bottom detection on nadir beam (meters).
Search maximum	f32	Maximum depth for initial bottom detection on nadir beam (meters).

11.16 1017 – Receiver Gain Type

Description: Sets the receiver gain type.

This command is only available for selected systems.

Table 132: 7500 Record Data – Command 1016

Name	Size	Description
Gain type	u32	0 – TVG 1 – Reserved for auto gain 2 – Fixed 3+ – Reserved
Reserved	u32 * 4	Reserved

11.17 1019 – Vernier Processing Parameters

Description: Sets parameters that control the Vernier processing, which is output in the 7019 record. The command applies only to the 200kHz 7130 system and the 200kHz 7131 system at this time.

Table 133: 7500 Record Data – Command 1019

Name	Size	Description
Field flags	u16	Bitfield indicating which parameters are to be applied by this command. <u>Bit 0:</u> Operational mode <u>Bit 1:</u> Decimation <u>Bit 2:</u> First sample <u>Bit 3:</u> Smoothing window type <u>Bit 4:</u> Smoothing window length <u>Bit 5:</u> Reference array <u>Bit 6-15:</u> Reserved
Operational mode	u32	0 – Vernier 1 – Single array Mag & Phase (power reduction - TBA) 3 – Triple array Mag & Phase (3 sets of records generated for each ping – one for each stave)
Decimation factor	u8	Data decimated by this factor, i.e. retain only 1 of X samples).
First sample	u32	Index of first sample to include in output record. Allows for reduction of 7019 record size via elimination of near range data.
Smoothing window type	u32	0 – Rectangular 2 – Hamming 99 – None
Smoothing window length	u16	Smoothing window length [samples]. Range = 3 to 63. Value must be odd.
Reference array	u8	Reserved for reference array selection (When <i>Operational Mode</i> is “Vernier” (0), this selects which array to use as reference array in Vernier processing. When <i>Operation Mode</i> is “Single array” (1), this selects which of the three 200kHz arrays is to be active. Valid values are 0, 1, or 2 in both cases.)
Reserved	4*u32	Reserved for future use

The mode settings allows the operator to switch between forward-looking bathymetry (normal mode) and imagery when operating the 7130 at 200kHz. The imagery mode can be useful for object analysis based on acoustic shadow for example.

The filter settings lets the operator choose whether a FIR (finite Impulse Response) low-pass filter is applied to the raw signal prior to elevation computation by Vernier processing. For bathymetry, a typical setting would be a rectangular filter of 19 taps. The longer the filter the smoother the output. For target detection, a short filter or no

filter is the preferred setting. The Hanning filter favors the samples close to the center of the filter window. For a given length it will have less effect than a rectangular filter.

The filter length from 1 (no filter) to 63 (longest filter that can be implemented) determine the degree of smoothing performed on the raw data.

11.18 1020 – Transmit Pulse Envelope Identifier

Description: Sets the Transmit Pulse Envelope.

This command is only available for selected systems.

Table 134: 7500 Record Data – Command 1020

Name	Size	Description
Envelope type	u32	0 – Rectangular 1 – Tukey 2 – FFFFFFFF - Reserved
Shading value	f32	Window shading value Tukey (0.0-1.0)
Reserved	u32 * 4	Reserved

11.19 1021 – Projector Beam Steering

Description: Horizontal and vertical projector beam steering.

This command is only available for selected systems.

Table 135: 7500 Record Data – Command 1021

Name	Size	Description
Projector beam steering angle vertical	f32	In radians
Projector beam steering angle horizontal	f32	In radians

11.20 1022 – Projector Beam Widths

Description: Horizontal and vertical projector beam widths.

This command is only available for selected systems.

Table 136: 7500 Record Data – Command 1022

Name	Size	Description
Projector beam –3dB beam width vertical	f32	In radians
Projector beam –3dB beam width horizontal	f32	In radians

11.21 1026 – Transmit Center Frequency

Description: Center transmit frequency.

This command is only available for selected systems.

Table 137: 7500 Record Data – Command 1026

Name	Size	Description
Frequency	f32	In Hz

11.22 1027 – Transmit Frequencies for Chirps

Description: Transmit pulse start and stop frequencies.

This command is only available for selected systems.

Table 138: 7500 Record Data – Command 1027

Name	Size	Description
Start frequency	f32	In Hz
Stop frequency	f32	In Hz

11.23 1033 – Motion Compensation

Description: Sets motion compensation options. Roll compensation status is reported for each ping in the receive flags field of the 7000 and 7503 records. Pitch compensation status is reported for each ping in the transmit flags field of the 7000 and 7503 records. Motion compensation capability varies depending on system type.

Table 139: 7500 Record Data – Command 1033

Name	Size	Description
Roll	u8	0 – OFF >0 – ON
Pitch	u8	0 – OFF >0 – ON
Heave	u8	N/A
Speed	u8	N/A
Reserved	u8 * 8	Reserved

11.24 1034 – Match Filter Parameters

Description: Sets the match filter parameters.

This command is only available for selected systems.

Table 140: 7500 Record Data – Command 1034

Name	Size	Description
Window type	u32	0 – Rectangular 1 – Kaiser 2 – Reserved for Hamming 3 – Reserved for Blackmann 4 – Reserved for Triangular 5 – Reserved for X (Taylor) 6 – FFFFFFFFFF – Reserved
Shading value	f32	Window shading value
Reserved	u32 * 4	Reserved

11.25 1035 – Coverage Sector

Description: Sets the current coverage sector.

This command is only available for selected systems.

Table 141: 7500 Record Data – Command 1035

Name	Size	Description
Coverage sector	f32	Coverage sector in radians
Horizontal receiver beam steering angle	f32	Steering angle in radians (positive to starboard)

11.26 1037 – Motion Sensor Configuration

Description: Sets the motion sensor configuration.

This command is only available for selected systems.

Table 142: 7500 Record Data – Command 1037

Name	Size	Description
Format	u8	0 – TSS1 1 – SIMRAD EM1000 2 – SIMRAD EM3000 3 – NMEA \$PASHR 4 – OCTANS TAH

Name	Size	Description
Baud	u8	0 – 4800 1 – 9600 2 – 14400 3 – 19200 4 – 28800 5 – 38400 6 – 56000 7 – 57600 8 – 115200
Parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 – Mark
Data Bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
Stop Bits	u8	0 – 1 bit 1 – 2 bits
Orientation	u8	0 – Port Up 1 – Port Down
Reserved	u8	Reserved
Motion Latency	f32	Motion latency in seconds Valid range is 0 – 0.050
Reserved	u8 * 20	Reserved

11.27 1038 – FlexMode Parameters

Description: Set the FlexMode parameters.

Table 143: 7500 Record Data – Command 1038

Name	Size	Description
FlexMode sector coverage	f32	Coverage sector in radians
FlexMode sector steering	f32	Sector steering angle in radians (positive to starboard)

11.28 1039 – Beam Mode Selection

Description: Set the beam mode selection.

Table 144: 7500 Record Data – Command 1039

Name	Size	Description
Beam mode selection	u16	Zero based index number corresponding with the available beam modes in the sonar XML

11.29 1040 – System Sample Rate

Description: Sets system sample rate parameters. Applicable only for systems using the EM7218 receiver.

Table 145: 7500 Record Data – Command 1040

Name	Size	Description
IQ Rate	u32	0 – SR17K 1 – SR34K 2 – SR50K 3 – SR60K 4 – SR80K 5 – SR100K

11.30 1041 – Manual IMUX Control

Description: Sets IMUX bits manually, overriding the value which is normally supplied in the system configuration XML file. Applicable only for systems using the EM7218 receiver.

Table 146: 7500 Record Data – Command 1041

Name	Size	Description
IMUX	u32	The valid range is 0 - 7. NOTE: During normalization/calibration process the IMUX value is set to 4, regardless of any previous setting via this command.
Reserved	u32*2	Reserved, set to zero

11.31 1043 – Custom Beams

Description: Set the number of beams for the beamformer.

Table 147: 7500 Record Data – Command 1043

Name	Size	Description
Custom beams	u16	Custom number of beams. Zero for default.

11.32 1044 – Constant Spacing

Description: Set the constant beam spacing value on the seafloor in meters.

Table 148: 7500 Record Data – Command 1044

Name	Size	Description
Constant spacing	f32	<p>Constant beam spacing on the seafloor in meters.</p> <p>Used for equi-distant and FlexModes.</p> <p>The number of beams will vary depending on the seafloor depth. Setting this to zero will always use all beams.</p>
Flags	u32	<p>Bit1:Reduce coverage</p> <p>0 – Always maintain swath coverage</p> <p>1 – Allow swath coverage to be reduced</p>

11.33 1045 – Multi-Detect Parameters

Description: Sets parameters that control the Multi-Detect bottom detection processing. Multi-detect allows for *up to five* detections for each beam. The command affects the output of the 7017 and 7027 bathymetry records. Multi-detect is a licensed feature. If the license is not present, then this command will produce a “NACK” response.

NOTE
Multi-Detect currently use a version of the “G2” bottom detection algorithm as its basis. This may change in the future.

Table 149: 7500 Record Data – Command 1045

Name	Size	Description
Enable	u16	<p>Zero = Multi-detect OFF.</p> <p>Non-zero = Multi-detect ON.</p>
Object Size	u16	<p>Range of 1 to 100.</p> <p>Controls the sensitivity of the algorithm to Object Size. This is a unit-less quantity.</p> <p><i>Note: Increasing this parameter results in more detections on smaller objects. Decreasing this parameter results in fewer detections and only on larger objects.</i></p>

Name	Size	Description
Sensitivity	u16	<p>Range of 1 to 100.</p> <p>Controls the sensitivity of the algorithm to Amplitude. This is a unit-less quantity.</p> <p><i>Note: Increasing this parameter causes more objects to be detected.</i></p>
Max Detections	u16	<p>Range of 1 to 5.</p> <p>Limits the number of detections produced per beam. The maximum number of detections per beam is five.</p> <p><i>Note: If there are fewer clusters which are over the sensitivity threshold than the selected number of detections, only the number of valid detections shall be produced, i.e. detections will not be generated from clusters below the sensitivity threshold.</i></p>
Reserved	u16*2	Reserved, set to zero.

11.34 1046 – Power Saving

Description: Sets overall system power saving mode. Only components which support power saving modes are affected by this command.

NOTE
Apply on the moment of writing to the T-20-S only until software updates are released for other systems.

Table 150: 7500 Record data – Command 1046

Name	Size	Description
Mode	u8	<p>0 : None. No power saving enabled at all. Can be used as reference.</p> <p>1 : Normal. Components save power when possible. No effect on operation.</p> <p>2 : Range Blank. Normal saving + “real” samples are not output from RX controller until X range is reached. X is controlled by the <u>Flags</u> and <u>Range Blank Control</u> fields.</p> <p>3 : Sleep. Components will be put in sleep mode. Sleep mode has 0 to 50ms recovery time. All settings will be retained. NO DATA is produced in sleep mode.</p> <p>4 : Hibernate. Components will be put in hibernate mode. Hibernate mode has 0 to 10 second recovery time. All settings will be retained. NO DATA is produced in hibernate mode.</p>
Flags	u8	Bits 0 – 7 : Reserved, zero.

Name	Size	Description
Range Blank Control	u16	Used only for power saving mode 2 ("Range Blank" mode). Controls size of range blanking interval. Ping data during this time interval will be zero. Only affects receiver component. This value gives the range blanking interval as a percent of the range scale (0 – 100). The number of samples blanked will change with range settings in this case.

11.35 1047 – AUV Configuration Options

Description: Allows control of AUV / ROV focused system features. The initial (installation default) value for these options is determined by the system XML file. Thereafter the settings are remembered in the system parameter file, and changed via this remote command.

NOTE
Apply on the moment of writing to the T-20-S only until software updates are released for other systems.

Table 151: 7500 Record Data – Command 1047

Name	Size	Description
Startup Normalization	u8	Non-zero to enable normalization at startup.
Restore Ping Rate	u8	Non-zero to restore ping rate to previous setting (which was in effect when system was last shut down).
Restore Power	u8	Non-zero to restore power to previous setting. Otherwise system starts with power OFF.
SV Interlock	u8	Non-zero to enable Sound Velocity Interlock safety feature (for system with integrated SV probe only).
Ignore PPS Errors	u8	Non-zero to suppress error messages due to PPS signal errors. Proper functioning of the PPS signal is normally required for accurate data time-stamping in bathymetry systems.
RESERVED	u8*15	Reserved. Zero.

11.36 1048 - Duty-Cycle Limitation Control Method

Description: System TX duty-cycle must be controlled (limited) to protect the sonar hardware. If the requested ping rate, power (source) level and pulse length result in a potentially damaging TX duty-cycle, then the system will automatically reduce either the ping rate or the power setting. This command controls which parameter (ping rate or power) is reduced in this case.

Table 152: 7500 record Data – Command 1048

Name	Size	Description
Method	u16	0 – Ping Rate 1 – Power (source) Level 2+ – Reserved

NOTE
When DC limitation via Power level is selected, the existing formula is applied that gives the MINIMUM ping period to satisfy a given duty cycle.
If the MINIMUM ping period is greater than the existing ping period (inverse ping rate), then the power ("POWER_DB" in formula below) is iteratively reduced by 1dB until the minimum ping period meets the actual ping period.
$\text{PING_PERIOD} = \text{PULSE_LENGTH} * (\text{pow}(10, \text{POWER_DB}/10) / \text{pow}(10, \text{MAX_POWER_DB}/10)) / \text{DUTY_CYCLE}$
The resulting reduced power setting is set via internal remote command and echo'd so that the GUI/SUI slider is correctly updated to reflect the change.

11.37 1050 – Single Record Request

Description: Request latest record.

Table 153: 7500 Record Data – Command 1050

Name	Size	Description
Record type	u32	Possible responses: 7501 – Followed by the requested record, will be one of the following: 1002, 1003, 1004, 1005, 1006, 1007, 1008, 1009, 1010, 1011, 1012, 1013, 1014, 1015, 1016, 1050, 7001, 7002, 7004, 7005, 7022, 7050, 7052, 7400, 7503, 7610, 7611, 7612. 7502 (NACK)

11.38 1051 – Record Subscription

Description: Subscribe to records. The host is responsible to keep this connection alive as well as re-establish a lost connection to the 7-P processor.

Table 154: 7500 Record Data – Command 1051

Name	Size	Description
N	u32	Number of records
Array of record numbers	u32 * N	Possible responses: 7501 – Followed by a subscribed record(s). In the record definitions is stated if a record can be subscribed. 7502 (NACK)

11.39 1052 – End All Subscriptions

Description: Unsubscribe to all records.

This command has no parameters.

11.40 1053 – Third Party Data Connection

Description: Add UDP or TCP connection to 7k sonar source, with specification of records to subscribe to.

Table 155: 7500 Record Data – Command 1053

Name	Size	Description
Address	u32	IP address (little endian data order)
Port	u16	Port number
Type	u16	0 – UDP 1 – TCP
# Records	u32	Number records
Record list	u32 * N	Array of record IDs, N = # Records

11.41 1054 – Delete Third Party Data Connection

Description: Delete UDP or TCP connection to 7k sonar source. All three parameters must match those provided in the 1053 record for the connection to be deleted.

Table 156: 7500 Record Data – Command 1054

Name	Size	Description
Address	u32	IP address (Little endian data order)
Port	u16	Port number
Type	u16	0 – UDP 1 – TCP

11.42 1055 – Data Feed, Range of Records

Description: Create data feed for a range of numerically continuous records. The host is responsible to keep this connection alive as well as to re-establish a lost connection to the 7-P processor. Subscribers are cautioned to choose reasonable ranges of defined records to avoid numerous log file messages for as yet undefined records.

Table 157: 7500 Record Data – Command 1055

Name	Size	Description
Start record ID	u32	Start record ID
End record ID	u32	End record ID

11.43 1056 – Unsubscribe Records on Data Feed

Description: Remove specified records from the subscription list of a connection. The subscription list is set via the 1051 or 1055 records. The feed will be stopped if no records are left in the subscription list after this record is sent.

Table 158: 7500 Record Data – Command 1056

Name	Size	Description
N	u32	Number of records
Array of record numbers	N * u32	Any records that are subscription-enabled for the current system

11.44 1099 – Stop Sonar Source

Description: Causes 7k sonar source process to stop. Should always be acknowledged.

This command has no parameters.

11.45 1100 – Start Pinging

Description: Start continuous pinging.

(Pinging will not start if the Max Ping Rate is set to zero.)

(This command will change the triggering configuration of the sonar to internal; external triggering overruled)

This command has no parameters.

11.46 1101 – Stop Pinging

Description: Stop pinging.

This command has no parameters.

11.47 1102 – Load Factory Parameters

Description: Load Factory Parameters from disk.

This command has no parameters.

11.48 1103 – Snippet Control

Description: Limit record 7028's sample range to a window around the bottom detection ranges.

NOTE
Have the same working as 7008 record (i.e. obsolete and will cause undefined behavior if used in conjunction with 7028 record).

Table 159: 7500 Record Data – Command 1103

Name	Size	Description
Enable	u32	0 – Disable snippet sample limitation 1 – Enable snippet sample limitation
Window size	u32	Number of samples around bottom detection for each beam

11.49 1107 – Single Ping Request

Description: Request for a single ping.

This command has no parameters.

NOTE
This request will halt continuous pinging if it has been started.

11.50 1109 – System Health Verification

Description: Request System Health snapshot text file to be created. The file name is created according to *section 8.2 File Nomenclature* with a .txt extension.

File is named “7kSystemHealth. The file will be created in the 7k sonar source executable directory. For remote connections (UDP/TCP) with the Sonar UI, an additional file will be created in the SeaBat executable directory.

This command has no parameters.

11.51 1111 – Multi-ping Control Enable

Description: Set multi-ping control parameters. Note that if the number of pings field is 0 or 1, then multi-ping mode is turned OFF, and the begin frequency and spacing fields are ignored. Multi-ping capability varies depending on system type.

Table 160: 7500 Record Data – Command 1111

Name	Size	Description
Number of pings in sequence	u16	0, 1 – Single ping mode (default) 2 – 2 pings 4 – 4 pings
Begin frequency	u32	First ping frequency (Hz)
Spacing	i32	Frequency spacing (Hz, may be negative)

NOTE

Currently the Begin Frequency and Spacing fields are not used. Each ping in the multi-ping sequence is spaced evenly about the base (center) frequency, and the spacing is not adjustable. E.g. for 2 ping mode, frequency for ping #1 = center frequency – (fixed spacing / 2); frequency for ping #2 = center frequency + (fixed spacing / 2). For instance, the center frequency is 400kHz, the spacing is set at 30kHz then ping#1 is 385kHz and ping#2 is 415kHz.

The actual frequency value for each ping is reported in the 7000 record, which is generated for each ping in the multi-ping sequence.

11.52 1113 – Calibrated Snippet Control

Description: Limit record 7058's sample range to a window around the bottom detection ranges.

Table 161: 7500 Record Data – Command 1113

Name	Size	Description
Enable	u16	0 – Disable snippet sample limitation 1 – Enable snippet sample limitation
Window size	f32	Number of samples around bottom detection for each beam
Flags	u32	BIT FIELD: <u>Bit 0:</u> Bottom detection window selected <u>Bit 1:</u> Snippet display window selected <u>Bit 2:</u> Quality control <u>Bit 3:</u> Minimum window size is required <u>Bit 4:</u> Maximum window size is required <u>Bit 6-31:</u> Reserved

Name	Size	Description
Flag	u8	BIT FIELD: <u>Bit 0:</u> Require brightness quality to pass <u>Bit 1:</u> Require colinearity quality to pass <u>Bit 2-7:</u> Reserved
Minimum window size	u32	Minimum number of samples around bottom detection for each beam
Maximum window size	u32	Maximum number of samples around bottom detection for each beam

11.53 1114 – External Trigger

Description: Starts pinging on external trigger. Should always be acknowledged.

This command has no parameters.

11.54 1115 – Trigger Out

Description: Sets output trigger on ping command.

Table 162: 7500 Record Data – Command 1115

Name	Size	Description
State	u32	BIT FIELDS: <u>Bit 0:</u> 1 – Enabled 0 – Disabled <u>Bit 1:</u> 1 - Trigger for entire Rx duration (depends on range setting) Length field is ignored. Not supported on all systems. 0 – Fixed length trigger, defined by <i>Length</i> field <u>Bit 2-31:</u> Reserved (must be zero)
Length	f64	Trigger length (in seconds)
Offset	f64	Trigger delay after ping command (in seconds)

11.55 1116 – PPS Edge Control

Description: Sets PPS input edge control.

Table 163: 7500 Record Data – Command 1116

Name	Size	Description
PPS Edge	u32	BIT FIELD: <u>Bit 0:</u> 0 – Rising 1 – Falling <u>Bit 1-31:</u> Reserved

11.56 1118 – Snippet Control

Description: Limits snippet sample range.

NOTE
This command may affect old 7008 record's format.

Table 164: 7500 Record Data – Command 1118

Name	Size	Description
Snippet Control Flags	u32	BIT FIELD: (1 – Enabled) <u>Bit 0:</u> Use automatic snippet window <u>Bit 1:</u> Include at least samples around bottom detection (min. window size is valid) <u>Bit 2:</u> Include at most samples around bottom detection (max. window size is valid) <u>Bit 3-31:</u> Reserved
Snippet Control Min. Window	u32	Used as Minimum Window Size when bit 0 is set (<i>automatic window</i>) AND bit 1 is set. Used as Fixed Window Size when flags bit 0 is NOT set (<i>fixed window</i>).
Snippet Control Max. Window	u32	Max snippet window. Used when flags bit 2 is set.

Automatic snippet window, if enabled, is constructed to allow 3dB overlap between beams.

In snippet control command at least one of the three control flags has to be enabled; but they can be used all three together.

11.57 1138 – Element Limit Control

Description: Limit the number of elements and/or samples in record 7038.

Table 165: 7500 Record Data – Command 1138

Name	Size	Description
Sample type	u16	16, 12 or 8 bits
Min sample	u32	Start sample number. 0 to samples – 1
Max sample	u32	Stop sample number. 0 to samples – 1 0xffffffff
Number of elements (E)	u16	0 – All elements 0xffff – If calibration is available, only “good” elements will be included. Otherwise, all elements are included. Otherwise, number of elements to follow
Elements	u16 * E	List of elements to include. Element numbers are zero based.

11.58 1200 – Start Recording

Description: Start recording. The directory (see ID 1207) and file name combined must not exceed 256 characters. The string should be of the form <filename in u8></0><0 in u8 to fill to a total length of 256>

Table 166: 7500 Record Data – Command 1200

Name	Size	Description
Reserved	u32	Reserved – must be 0
Filename	c8 * 256	Null terminated ASCII string. Maximum 256 characters, including null character. If the filename is NULL (empty), the file name is created according to <i>section 8.2 File Nomenclature</i> (i.e., UTC time stamp). If the file name is not fully qualified (no drive and/or directory) or NULL, the file will be saved in the application directory, unless a different default directory has been selected with command 1207. If a fully qualified path name – including drive (or UNC network resource), directory, and filename – is supplied, it will be used. The directory must exist. It will not be created. The .s7k extension will be added to the filename. The file name length + the directory path length cannot exceed 256 characters.

11.59 1201 – Stop Recording / Playback

Description: Stop recording or playback (whichever is in progress).

This command has no parameters.

11.60 1202 – Start Playback

Description: Sets up playback mode and begins record output. A NACK is generated if the file name is NULL, or if the current state is PLAYBACK or RECORDING when this record is received.

Table 167: 7500 Record Data – Command 1202

Name	Size	Description
Start flag	u16	1 – Time in seconds 2 – Record number
Start point	u32	Seconds or record number
Frequency	i32	Playback frequency 0 – Real Time <0 – As fast as possible >0 – Records per second
File name	u8 * 256	Null-terminated ASCII string. 256 characters maximum, including null character. The full path (drive and directory) must be specified with the file name. (The directory specified in the 1207 command record will not be used.)

11.61 1204 – Data Storage Status Request

Description: Returns status of data recorder (Record 7052).

This command has no parameters.

11.62 1206 – Set Warning Threshold(s)

Description: Set the low-drive-space warning threshold values. The warning levels are specified as percentages. Whenever free drive space on the active volume drops from one level to another, a 7051 (System Event) record will be generated by the 7k sonar source.

Table 168: 7500 Record Data – Command 1206

Name	Size	Description
N	u16	Number of integer percentage threshold values to follow. Maximum number is 100.
Value array	u32 * N	Array of N percentage threshold values. Must be in descending order.

11.63 1207 – Set Recording Directory

Description: Set DR data file storage directory. The combined directory and file name cannot exceed 256 characters. Data cannot be recording or playing for this command to be accepted.

Table 169: 7500 Record Data – Command 1207

Name	Size	Description
Directory	c8 * 256	New directory pathname. Null-terminated ASCII string. A trailing backslash ('\\') will be appended if necessary. Network paths should be specified as (for example): \\server\\directory. In the event that the directory does not exist, it will be created (if possible).

11.64 1209 – Set Filtering

Description: Sets playback mode OR record mode filtering. Allows for inclusionary record filtering during playback or recording.

The 7k records available for recording are listed below:

1000	1001	1002	1003	1004	1005	1006	1007	1008	1009
1010	1011	1012	1013	1014	1015	1016	1017	1020	1050
2004	3001	7000	7002	7004	7006	7007	7008	7011	7012
7017	7018	7021	7026	7027	7028	7038	7039	7048	7057
7058	7068	7503	7504	7505	7511	7610	7611	7612	8012

However, since new records are defined from time to time, and others may become obsolete, it is recommended to use the 7052 “recording status” record, which is available as a single record request or via subscription, in order to obtain the list of records supported by your version of the software. The 7052 record will contain the complete list of available records if the “Filter Method” field of the most recent 1209 command record is set to 0 (No filtering).

The minimal record set should include 7000, 7004, and either 7011 + 7027 (bathymetry) or 7018 (FLS). Full reprocessing of .s7k files requires water column data record 7018 or 7008 (obsolete). The Sonar UI enforces this minimal set via the 1209 command records it sends to the 7k sonar source.

Table 170: 7500 Record Data – Command 1209

Name	Size	Description
Filter type	u16	0 – By record
Filter method	u16	0 – None, all records will be included 1 – Inclusionary, ‘Filter List’ is the list of records for playback or recording
N	u16	Number of record IDs in ‘Filter List’ (maximum 128)

Name	Size	Description
Filter list	u32 * N	List of N record IDs for filtering to act upon

11.65 1211 – Logging Settings

Description: Set the 7K logger settings; single or multiple log file, lead-in or none lead-in ping data.

Table 171: 7500 Record Data – Command 1211

Name	Size	Description
Single or multiple file	u8	Zero = Write logfiles of multiple 1GB files Non-zero = Write single 7K logfile
Ping data history	u8	Zero = No lead-in ping data Non-zero = Write 10 sec of lead-in ping data

11.66 1400 – Autopilot Table Update

Description: Autopilot table to be loaded.

Table 172: 7500 Record Data – Command 1400

Name	Size	Description
Size	i32	Table size
Version	i32	Table version: currently set at 3
Mode	u32	0 – Range based 1 – Depth based
Rows	i32	Number of rows in table, based on number of valid ranges/depth increments for sonar (Max 100)
Range[0] sonar type	u32	0 – 7101 1 – 7111 2 – 7125 200kHz 3 – 7125 400kHz 4 – 7150 5 – Default 6+ – Not valid
Range[0] Min power	i32	Min power for this range
Range[0] Max power	i32	Max power for this range
Range[0] Min gain	i32	Min gain for this range
Range[0] Max gain	i32	Max gain for this range
Range[0] Min pulse length	f32	Min pulse length for this range
Range[0] Max pulse length	f32	Max pulse length for this range
Range[0] Tuning	u16*8	Algorithm tuning parameters
Range[0] Reserved	u32*4	Reserved

Name	Size	Description
.... Range[Rows-1]		Additional settings for each range/depth (row)
Row[0] Sonar type	u32	First row Sonar type (same as above)
Row[0] Bottom depth	f32	First row Depth
Row[0] Range	i32	First row Range
Row[0] Tx Power	i32	First row Power
Row[0] Gain	i32	First row Gain
Row[0] Spreading	i32	First row Spreading
Row[0] Absorption	i32	First row Absorption
Row[0] Tx Pulse length	i32	First row Pulse length
Row[0] Reserved	u32*4	First row Reserved
.... Row[Rows-1]		Last row Settings

11.67 1402 – Tracker Control

Description: Sets the state of the Tracker options.

Table 173: 7500 Record Data – Command 1402

Name	Size	Description
Tracker flags	u32	Bit 0: Enable range control Bit 1: Enable power & gain control Bit 2: Enable pulse length control Bit 3: Enable coverage angle control Bit 4: Use fixed swath width Bit 5: Set maximum coverage angle
Tracker swath width	f32	In meters
Tracker max coverage	f32	In radians

11.68 1502 – Full Rate Dual Head Control

Description: System dual head mode.

This command is not acknowledged if FRDH is not licensed.

Table 174: 7500 Record Data – Command 1502

Name	Size	Description
Dual head mode	u32	0 – Ping pong mode 1 – Full rate dual head (FRDH)

11.69 1600 – Custom Recording Control

Description: Set custom recording control parameters.

Table 175: 7500 Record Data – Command 1600

Name	Size	Description
Path name	c8 * 256	Full directory path name. Null terminated ASCII string. Maximum of 256 characters, including null character.
Header name	c8 * 256	Null terminated ASCII string. Maximum of 256 characters including null character.
Trailer name	c8 * 256	Null terminated ASCII string. Maximum of 256 characters including null character.
Prepend header	u8	When not zero: Prepend the file specified by the header name for each file.
Append trailer	u8	When not zero: Append the file specified by the trailer name for each record.
Record	u32	When not zero: Enable custom recording.

11.70 1601 – Custom Playback Control

Description: Set custom playback control parameters.

Table 176: 7500 Record Data – Command 1601

Name	Size	Description
Path name	c8 * 256	Full directory path name. Null terminated ASCII string. Maximum of 256 characters, including null character.
File name	c8 * 256	Null terminated ASCII string. Maximum of 256 characters including null character.
Loop mode	u32	0 – Play file once 1 – Loop the file 2 – Advance to next file
Play	u8	When not zero: Enable custom playback
Time stamps	u8	0 – Set new timestamps 1 – Keep original timestamps when playing the file

11.71 1602 – Custom Sensors

Description: Set HPR (heading, pitch roll) and SVP (sound velocity) sensors. The HPR sensor can optionally installed in the RTA and a SVP optionally connected to the sonar head.

Table 177: 7500 Record Data – Command 1602

Name	Size	Description
Use build in HPR	u8	0 – Use HPR sensor connected to RTA 1 – Use the build in HPR sensor
Use attached SVP sensor	u8	0 – Use SVP sensor connected to RTA 1 – Use attached SVP sensor

11.72 1603 – Stacking

Description: Set stacking

Table 178: 7500 Record Data – Command 1603

Name	Size	Description
Enable stacking	u8	0 – Disable stacking mode 1 – Enable stacking mode
Stacking value	u8	Number of results to stack min = 1, max = 9

11.73 1604 – Serial Ports

Description: Set serial ports

Table 179: 7500 Record Data – Command 1604

Name	Size	Description
ZDA port baudrate	u8	0 – 1200 1 – 2400 2 – 4800 3 – 9600 4 – 14400 5 – 19200 6 – 28800 7 – 38400 8 – 56000 9 – 57600 10 - 115200
ZDA port parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 - Mark
ZDA port data bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
ZDA port stop bits	u8	0 – 1 bit 1 – 2 bits

Name	Size	Description
GGA port baudrate	u8	0 – 1200 1 – 2400 2 – 4800 3 – 9600 4 – 14400 5 – 19200 6 – 28800 7 – 38400 8 – 56000 9 – 57600 10 - 115200
GGA port parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 - Mark
GGA port data bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
GGA port stop bits	u8	0 – 1 bit 1 – 2 bits
SVP port baudrate	u8	0 – 1200 1 – 2400 2 – 4800 3 – 9600 4 – 14400 5 – 19200 6 – 28800 7 – 38400 8 – 56000 9 – 57600 10 - 115200
SVP port parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 - Mark

Name	Size	Description
SVP port data bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
SVP port stop bits	u8	0 – 1 bit 1 – 2 bits
HPR port baud rate	u8	0 – 1200 1 – 2400 2 – 4800 3 – 9600 4 – 14400 5 – 19200 6 – 28800 7 – 38400 8 – 56000 9 – 57600 10 - 115200
HPR port parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 - Mark
HPR port data bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
HPR port stop bits	u8	
HDT port baud rate	u8	0 – 1200 1 – 2400 2 – 4800 3 – 9600 4 – 14400 5 – 19200 6 – 28800 7 – 38400 8 – 56000 9 – 57600 10 - 115200

Name	Size	Description
HDT port parity	u8	0 – None 1 – Even 2 – Odd 3 – Space 4 - Mark
HDT port data bits	u8	0 – 5 bits 1 – 6 bits 2 – 7 bits 3 – 8 bits
HDT port stop bits	u8	0 – 1 bit 1 – 2 bits

11.74 1605 – RRIO Addresses

Description: Set RRIO addresses.

Table 180: 7500 Record Data – Command 1605

Name	Size	Description
RRIO address1	c8 * 256	RRIO IP address :port ASCII string, max length 255 characters + null.
RRIO address2	c8 * 256	RRIO IP address :port ASCII string, max length 255 characters + null.
RRIO address2	c8 * 256	RRIO IP address :port ASCII string, max length 255 characters + null.

11.75 1606 – Custom Recording Quick Info

Description: Custom recording quick status information.

Table 181: 7500 Record Data – Command 1606

Name	Size	Description
Disk free	u16	Percentage free disk space
Number	u32	Number of records written
Size	u64	Size of recorded file
Record	u32	Non zero when recording is active
File name	c8 * 256	Name of current file being recorded ASCII string, max length 255 character + null
Error	u32	RDR error
Reserved	u32 * 30	Reserved

11.76 1607 – Head Tilt Angle

Description: Set Head tilt mounting angle.

Table 182: 7500 Record Data – Command 1607

Name	Size	Description
Head tilt	f32	In radians

11.77 1608 – Deck Mode

Description: Set deck mode; sonar is in degraded operation.

Table 183: 7500 Record Data – Command 1608

Name	Size	Description
Mode	u32	Deck mode Non zero: Sonar is in deck mode

11.78 1609 – Power Mode

Description: Give (windows) power mode of the sonar (Control Center) PC.

Table 184: 7500 Record Data – Command 1609

Name	Size	Description
Flags	u8	Bit 0: – Power mode is supported Bit 1: – Power mode CPU throttled Bit 2: – Power mode AC
Mode max	u8	Percentage on which the CPU is throttled between 0 – 100%

11.79 1610 – Power Built-In Applanix POS MV

Description: Power on the built-in Applanix POS MV.

This command has no parameters.

11.80 7041 – R7041 Setup

Description:

Table 185: 7500 Record Data – Command 7041

Name	Size	Description	Startup
Down-sampling Method	u8	0 – No down-sampling No down-sampling is performed and magnitude is recorded unchanged 1 – Nearest neighbor For each new sample the nearest original sample within the same beam is picked 2 – Linear approximation Each new sample is calculated as linear approximation of two original neighboring samples 3 – Averaging Each new sample is an average of all original samples within half new sampling period	1
Filtering Method	u8	0 – No filtering	0
Flags	u16	BIT FIELD: <u>Bit 0</u> : - Discard data beyond absolute gates If absolute gates are enabled, data series will be recorded only to maximum depth or range gate, whichever is less <u>Bit 1</u> : - Reduction relative to pulse length New sample periods calculated as Pulse Length * Multiplier <u>Bit 2</u> : - Reduction relative to sample rate New sample period is calculated as <i>original Sample Period * Multiplier</i> <u>Bit 3</u> : - Absolute reduction New sample rate is adjusted such as total number of samples would not exceed specified value in Multiplier/Size field <u>Bit 4-15</u> : - Reserved (always zero) Only one of 1-3 bits could be set	3
Multiplier/Size	f32/u32	For relative reduction, this field contains floating point multiplier value For absolute reduction this field contains integer number for max samples	1.0

11.81 7042 – Compressed Water Column Data Setup

Description: Allows configuration of Compressed Water Column record (7042). Note that the current value of these flags are reported in the ‘Flags’ field of the 7042 Compressed Water Column record. The settings are retained between executions of the 7k sonar source.

NOTE
Apply until software updates are released for other systems, on the moment of writing only to the T20 and T50 series.

Table 186: 7500 Record Data – Command 7042

Name	Size	Description
Flags	u32	<p>Bit field:</p> <p>Bit 0 : Use maximum bottom detection point <i>in each beam</i> to limit data. Data is included up to the bottom detection point + 10%. This flag has no effect on systems which do not perform bottom detection.</p> <p>Bit 1 : Include magnitude data only (strip phase).</p> <p>Bit 2 : Convert mag to dB, then compress from 16 bit to 8 bit. Phase compression simply truncates lower (least significant) byte of phase data.</p> <p>Bit 3 : Exclude data outside of absolute gates. Only applicable if absolute gates in use. (UNSUPPORTED IN THIS RELEASE)</p> <p>Bit 4-7 : Downsampling divisor. Value = (BITS >> 4). Only values 2-16 are valid. This field is ignored if downsampling is not enabled (type = “none”).</p> <p>Bits 8-11 : . Downsampling type:</p> <ul style="list-style-type: none"> 0x000 = None 0x100 = Middle value 0x200 = Peak value 0x300 = Average value

11.82 7610 – Manual Sound Velocity

Description: Set SVP filtering manual sound velocity value, with optional ‘override’ flag. If override flag is set, then 7610 records received by the 7k sonar source from other clients (e.g. Teledyne PDS) will be ignored.

Table 187: 7500 Record Data – Command 7610

Name	Size	Description
Flags	w16	<p>BIT FIELD:</p> <p><u>Bit 0: Manual Override</u> If set any subsequent 7610 record will be ignored, otherwise any subsequent 7610 record will change the Sound Velocity value</p> <p><u>Bit 1: Settings Only</u> If set the Sound Velocity value will not be updated and Sound Velocity field within this remote command will be ignored</p> <p><u>Bit 2: Filter Setting</u> If set SVP Filter type will be changed, otherwise SVP Filter field within this remote command will be ignored</p> <p><u>Bit 3-15: Reserved, must be zeros</u></p>
Sound velocity	f32	Sound velocity in m/s
SVP Filter	u8	<p>SVP Filter type</p> <p>1 – No Filter 2 – Light Filter 3 – Normal Filter 4 – SVP70 Wizard</p> <p>NOTE: to change the filter values Flags Bit 2 must be set</p>
Reserved	u8*3	Reserved

11.83 7614 – Manual Temperature Control

Description: Set Temperature, with optional ‘override’ flag. If override flag is set, then 7614 records received by the 7k sonar source from other clients (e.g. Teledyne PDS) will be ignored.

Table 188: 7500 Record Data – Command 7614

Name	Size	Description
Flags	u16	<p>BIT FIELD:</p> <p>Bit 0: Manual Override If set any subsequent 7614 record will be ignored, otherwise any subsequent 7614 record will change the Temperature value.</p> <p>Bit 1: Settings Only If set the Temperature value will not be updated and Temperature field within this remote command will be ignored.</p> <p>Bit 2-15: Reserved, must be zeros</p>
Temperature	f32	Temperature (°C)
Reserved	u16*2	Reserved. Set to zero.

12 BLUEVIEW DATA FORMAT DEFINITION

The BlueView ProScan software uses the RESON 7K data format with the definitions and conventions as specified earlier in this document.

There are five types of network data records provided by the MB Sonar/ProScan software system. They are the Sonar Configuration record, the Multibeam Configuration record, the Bathymetry record, the Pan/Tilt Configuration record, and the Pan/Tilt Position record.

NOTE
The record definitions defined in this DFD version applies for ProScan version 3.12 and higher. Refer to DFD version 2.40 for the definition of records which applies for ProScan version 3.11 or lower.

There are small differences for the network frame as specified in section 7 and the Data Record Frame as specified in section 6 compared to BlueView. See the below sections for the BlueView frame specifications and the record definition.

12.1 BlueView Network Frame Format

The following table lays out the format for the Network Frame.

Name	Data Type	Description
Protocol version	u16	Identifies the version of this record.
Offset	u16	Offset in bytes to the start of the Data Type Header from the start of this Network Frame.
Reserved	u32	Reserved
Reserverd	u16	Reserved
Reserved	u16	Reserved
Packet Size	u32	Size in bytes of this packet, including the header and appended data
Total Size	u32	Total size in bytes of all packets in transmission, excluding network frame(s).
Reserved	u32	Reserved
Reserved	u32	Reserved
Reserved	u16	Reserved
Reserved	u16	Reserved
Reserved	u32	Reserved

12.2 BlueView Data Record Frame

The following table lays out the format for the Data Record Frame

Name	Data Type	Description
Protocol version	u16	Identifies the version of this record.
Offset	u16	Offset in bytes from the start of the Sync Pattern to the start of the Data Container.
Sync Pattern	u32	0x0000FFFF
Data Size	u32	Size of the DTH and Data Container portion of the network record.
Reserved	u32	Reserved
Reserved	u32	Reserved
7KTIME	u8*10 (7K Time)	Timestamp indicating when data was generated.
Record version	u16	Version of the specified record
Record Type Identifier	u32	Identifies the kind of data stored in the Data Container. The legal values are: 7000: Sonar Configuration 7004: Multibeam Configuration 7006: Bathymetry 5835: Pan/Tilt Configuration 5836: Pan/Tilt Position
Device Identifier	u32	ProScan device identifier
Reserved	u16	Reserved
Reserved	u16	Reserved
Reserved	u32	Reserved
Flags	u16	BIT FIELD: Bit 0:Checksum 0 – Invalid checksum 1 – Valid checksum Bit 1-14: Reserved (must be zero) Bit 15: 0 – Live data 1 – Recorded data
Reserved	u16	Reserved
Reserved	u32	Reserved
Reserved	u32	Reserved

Name	Data Type	Description
Reserved	u32	Reserved
DATA SECTION	Variable	Payload of the network record.
Checksum	u32	<p>Sum of all byte values (treated as unsigned) in the record from the beginning of the version field to the end of the data section. The use of this field is optional and depends on bit 1 of the Flags field.</p> <p>The checksum should be computed as a 32 bit unsigned integer.</p>

12.3 7000 Sonar Configuration Container format

Description: This record contains the current sonar settings. For every sonar ping, the Sonar Configuration record is transmitted.

Data Definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 189: 7000 – Record Type Header

Name	Data Type	Description
Sonar Serial Number	u64	Identifies sonar.
Ping Number	u32	Identifies a particular ping.
Reserved	u16	Reserved
Frequency	f32	Transmit frequency in Hertz
Reserved	f32	Reserved
Reserved	f32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	f32	Reserved
Maximum Range	f32	Maximum Range setting in meters
Reserved	f32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved

Name	Data Type	Description
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	u32	Reserved
Reserved	f32	Reserved
Reserved	u16	Reserved

12.4 7004 Multibeam Configuration Container Format

Description: This record contains the receive beam widths and steering. For every sonar ping, the Multibeam Configuration is transmitted.

Data definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 190: 7004 – Record Type Header

Name	Data Type	Description
Sonar Serial Number	u64	Identifies sonar.
Number of Beams	u32	Number of receiver beams.
Reserved	f32 * Number of Beams	Reserved
Beam Bearing Angle	f32 * Number of Beams	The bearing, in +/- radians, from the center of the sonar for each beam.
Reserved	f32 * Number of Beams	Reserved
Reserved	f32 * Number of Beams	Reserved

12.5 7006 Bathymetry Container Format

Description: This record contains the bottom detection results. For every sonar ping, the Bathymetry network record is transmitted.

Data definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 191: 7006 – Record Type Header

The following table lays out the format for the Bathymetry container.

Name	Data Type	Description
Sonar Serial Number	u64	Identifies sonar.
Ping Number	u32	Identifies a particular ping.
Mult-Ping Sequence	u16	If not zero, then this is the sequence number of the ping in the multi-ping sequence.
Number of Beams	u32	Number of receiver beams.
Reserved	u8	Reserved
Sound Velocity Source	u8	Identifies source of sound velocity. 0 = Measured 1 = Manually Entered
Sound Velocity	f32	Sound velocity in meters/second

Range	f32 * Number of Beams	Two-way travel time in seconds
Range Quality	u8 * Number of Beams	Indicates where ranges are valid. 0x07 = Valid 0x06 = Invalid
Reserved	f32 * Number of Beams	Reserved
Start Range Window	f32 * Number of Beams	Two-way travel time in seconds
Stop Range Window	f32 * Number of Beams	Two-way travel time in seconds

12.6 5835 Pan/Tilt Configuration Container Format

NOTE
Refer to APPENDIX H - Data Transformations (BlueView) - for a description of how to populate the function coefficients and arguments based on the values in the PanTilt Configuration record and the PanTilt Position record.

Description: This record contains the pan/tilt configuration parameters. For every sonar ping, the Pan/tilt Configuration record is transmitted.

Data definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 192: Record Type Header

The following table lays out the format for the Pan/Tilt Configuration container. The size of the complete record, i.e., Network Frame, Data Record Frame, and PanTiltCalibration, is 323 bytes.

Name	Size	Description
Version Number	u16	Version number of this record format.
Sonar ID	u64	Sonar Serial number
Head ID	u16	Specific Head on the sonar
Manufacturer	u8 * 80	Pan/Tilt Manufacturer
Model	u8 * 80	Pan/Tilt Model
Tilt Elbow Offset	f32	Length in meters from tilt axis to sonar central axis (See Figure 13-2: Pan/Tilt Offsets)
Pan Arm Offset	f32	Length in meters from pan axis to sonar acoustic center (See Figure 13-2: Pan/Tilt Offsets)

Name	Size	Description
Tilt Axis Offset	f32	Length in meters from Pan/Tilt unit base to tilt axis (See Figure 13-2: Pan/Tilt Offsets)
Head Roll Orientation	f32	Roll angle in degrees of the head about P/T Base Y axis. In most cases, a guide pin directs the head to the 0 degree roll angle.
Pan Calibration Position	f32	Raw degrees reported by the pan/tilt base motor at "calibrate" position
Tilt Calibration Position	f32	Raw degrees reported by the pan/tilt elbow motor at "calibrate" position
Is Scanning	u8	If the Pan/Tilt is performing a scan 0 = Stationary 1 = Scanning 2+ = Reserved If 1 the following 4 fields are valid:
Scan Pan start Raw Angle	f32	Raw degrees reported by the pan/tilt base
Scan Pan Stop Raw Angle	f32	raw degrees reported by the pan/tilt base
Scan Tilt Start Raw Angle	f32	If a spherical scan*, the first tilt angle to use raw degrees reported by the pan/tilt elbow
Scan Tilt Stop Raw Angle	f32	If a spherical scan*, the last tilt angle to use raw degrees reported by the pan/tilt elbow

*The start and stop angles tilt angles will be the same if this is a single (i.e., non-spherical) scan.

12.7 5836 Pan/Tilt Position Container Format

NOTE
Refer to APPENDIX H - Data Transformations (BlueView) - for a description of how to populate the function coefficients and arguments based on the values in the PanTilt Configuration record and the PanTilt Position record.

Description: This record contains the position readings of the pan/tilt unit. For every sonar ping, the Pan/Tilt Position record is transmitted.

Data definition:

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Table 193: Record Type Header

The following table lays out the format for the Pan/Tilt Position container. The size of the complete record, i.e., Network Frame, Data Record Frame, and Pan/Tilt Position, is 132 bytes.

Name	Size	Description
Version Number	u16	Version number of this record format.
Sonar ID	u64	Sonar Serial number
Head ID	u16	Specific Head on the sonar
Ping number	u32	
Pan Position	f32	Degrees about P/T Base Z-axis (right handed)
Tilt Position	f32	Degrees about P/T Base X-axis (right handed)
Reserved	f32	Reserved

13 FREQUENTLY ASKED QUESTIONS

13.1 7kCenter

Q: How does 7kCenter handle connections from multiple clients?

A: If two clients connect on port 7000 then they get a different local port number, and will be handled separately by 7kCenter.

Q: Are Acknowledge / Not Acknowledge guaranteed to only be returned on the channel that requested them?

A: ACK and NAK are only sent to the client that issued the remote control command (7500 sub record).

Q: Is it a problem to send multiple commands before the first one has returns a reply, or are they just queued?

A: Commands are queued. You don't need to wait for the ACK/NAK reply.

Q: We often power on the sonar sub-sea and start sending commands; is there a particular initialization sequence we need to get through?

A: If you have normalization at start-up enabled then the system will be locked during normalization. All commands will fail with a NAK reply with error code REMOTE_COMMAND_DENIED.

Q: What can change the sonar's state other than a 7500 record from our interface software?

A: Only the normalization at start-up will temporarily change the state. After that, it will only react to external commands.

Q: It might help to lock out the sonar with a 1503 "Reserved for system lock" command, but it's undocumented. What are the semantics for that?

A: The system lock is currently only used internally to lock everyone out while the system is normalizing. This is so that nothing can change the sonar settings while the system is running through the various gain steps.

Q: If system A locks the sonar, can system B force-unlock it?

A: Only the client that locked the system can unlock it.

Q: Are there circumstances in which the sonar will spontaneously change max range, e.g., as a result of an error or something?

A: The Tracker can change the range when it is enabled.

Q: The legacy UI seems to update some parameters with a system ID of 7000, some with 7125 but always a system enumerator of 0, and some with the correct device ID and system enumerator for whichever system is pinging. Do some commands apply globally to all enumerated devices controlled by a given 7kCenter instance? Which ones?

A: ID 7000 addresses the 7kCenter itself (e.g. when single record requesting record 7001). It is not checked. You can always use the device ID of the system (7125 in your case). You should use the device ID from the 7001 record (XML configuration).

Enumerator 0 addresses all sub-systems (e.g. the dual frequencies 200 and 400 kHz on 7125). On an integrated dual head system (e.g. T50 IDH) it will address both heads. The enumerator can then be used to send commands to one specific head via enum 1 and 2.

APPENDIX A TELEDYNE PDS OPTIONAL DATA

The following tables show optional data created by Teledyne PDS when the S7K file is logged by, or exported from Teledyne PDS.

NOTE
The information in an s7k file logged in 7k Center and an s7k file logged in acquisition software package (in this case PDS) is different. 7k Center is using the sensor data; PDS is using reference point data.

Use tables to maintain compatibility with Teledyne PDS.

DRF	RTH	RD	OD	DRF
-----	-----	----	----	-----

Optional data 7006 record:

Table 194: 7006 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians -π/2 to π/2, south negative
Longitude	f64	Longitude of vessel reference point in radians -π to π, west negative
Heading	f32	Heading of vessel at transmit time in radians
Height source	u8	Method used to correct to chart datum. If height source = 1, then Tide = '0'. 0 – None 1 – RTK 2 – Tide
Tide	f32	In meters
Roll	f32	Roll (in radians) at transmit time
Pitch	f32	Pitch (in radians) at transmit time
Heave	f32	Heave (in radians) at transmit time
Vehicle depth	f32	Vehicle depth at transmit time in meters
The following set of data items are repeated for each beam:		
Beam 0 – Depth	f32	Depth relative chart datum (or relative waterline if Height source = 0) (in meters)
Beam 0 – Along track distance	f32	Along track distance in vessel grid (in meters)
Beam 0 – Across track distance	f32	Across track distance in vessel grid (in meters)

Name	Size	Description
Beam 0 – Pointing angle	f32	Beam pointing angle from vertical in radians
Beam 0 – Azimuth angle	f32	Beam azimuth angle in radians

Optional data 7007 record:

Table 195: 7007 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians - $\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians - π to π , west negative
Heading	f32	Heading of vessel at transmit time in radians
Depth	f32	Nadir depth for slant range correction in meters

Optional data 7008 record:

Table 196: 7008 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in Radians - $\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians - π to π , west negative
Heading	f32	Heading of vessel at transmit time in radians

Following set of data items is repeated for each beam:

Beam – Along track distance	f32	Along track distance in vessel grid in meters
Beam – Across track distance	f32	Across track distance in vessel grid in meters
Center sample number	u32	Sample number at detection point of beam

Optional data 7027 record:

Table 197: 7027 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians - $\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians - π to π , west negative

Name	Size	Description
Heading	f32	Heading of vessel at transmit time in radians
Height source	u8	Method used to correct to chart datum. If height source = 1, then Tide = '0'. 0 – None 1 – RTK 2 – Tide
Tide	f32	In meters
Roll	f32	Roll (in radians) at transmit time
Pitch	f32	Pitch (in radians) at transmit time
Heave	f32	Heave (in radians) at transmit time
Vehicle depth	f32	Vehicle depth at transmit time in meters
The following set of data items are repeated for each beam:		
Beam 0 – Depth	f32	Depth relative chart datum (or relative waterline if Height source = 0) (in meters)
Beam 0 – Along track distance	f32	Along track distance in vessel grid (in meters)
Beam 0 – Across track distance	f32	Across track distance in vessel grid (in meters)
Beam 0 – Pointing angle	f32	Beam pointing angle from vertical in radians
Beam 0 – Azimuth angle	f32	Beam azimuth angle in radians

Optional data 7028 record:

Table 198: 7028 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians $-\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians $-\pi$ to π , west negative
Heading	f32	Heading of vessel at transmit time in radians
Following set of data items is repeated for each beam:		
Beam – Along track distance	f32	Along track distance in vessel grid in meters
Beam – Across track distance	f32	Across track distance in vessel grid in meters
Center sample number	u32	Sample number at detection point of beam

Optional data 7057 record:

Table 199: 7057 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians - $\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians - π to π , west negative
Heading	f32	Heading of vessel at transmit time in radians
Depth	f32	Depth for slant range correction in meters

Optional data 7058 record:

Table 200: 7058 – Optional Data

Name	Size	Description
Frequency	f32	Ping Frequency in Hz
Latitude	f64	Latitude of vessel reference point in radians - $\pi/2$ to $\pi/2$, south negative
Longitude	f64	Longitude of vessel reference point in radians - π to π , west negative
Heading	f32	Heading of vessel at transmit time in radians

Following set of data items is repeated for each beam:

Beam – Along track distance	f32	Along track distance in vessel grid in meters
Beam – Across track distance	f32	Across track distance in vessel grid in meters
Center sample number	u32	Sample number at detection point of beam

Optional data 7400 record:

Table 201: 7400 – Optional Data

Name	Size	Description
UTC time	f64	Time since midnight in HHMMSS.SS format
External time	f64	UTC Time in milliseconds since 1 Jan 1970
T0	f64	T Null Time in milliseconds since 1 Jan 1970
T1	f64	T One Time in milliseconds since 1 Jan 1970
Pulse length	f64	Pulse length in milliseconds
Difference	f64	Difference between computer clock and External time in milliseconds
IO Module status	u16	IO Module synchronization status

APPENDIX B DEVICE IDENTIFIERS

The Data Record Frame (see *Table 5: Data Record Frame*) requires a Device Identifier parameter. The table below provides the list of valid Device Identifiers and their descriptions.

Table 202: Device Identifiers

Identifier	Vendor	Description
20	RESON	Single head SeaBat™ T20-P & SeaBat™ T20-S
22	RESON	Integrated dual head SeaBat™ T20-R
50	RESON	Single head SeaBat™ T50-P & SeaBat™ T50-R
52	RESON	Integrated dual head SeaBat™ T50-R
100		Generic Position Sensor (e.g., GPS)
101		Generic Heading Sensor (e.g., Gyro)
102		Generic Attitude Sensor
103		Generic MBES
104		Generic Side-scan Sonar
105		Generic Sub-bottom Profiler
1000	Odom	Odom MB1
1001	TrueTime	PCISG
1002	Odom	Odom MB2
2000	CDC	SMCG
2001	CDC	SPG
2002	Empire Magnetics	YS2000 Rotator
4013	RESON	TC4013
6000	RESON	DiverDat
7000	RESON	7k sonar source
7001	RESON	7k User Interface
7003	RESON	Teledyne PDS
7004	RESON	7k Logger
7005	BlueView	BlueView ProScan
7012	RESON	SeaBat™ 7012
7100	RESON	SeaBat™ 7100

13007	NORBIT	Reserved for NORBIT
13008	NORBIT	iWBMSLidar
13009 - 13099	NORBIT	Reserved for NORBIT
14000	RESON	HydroSweep 3 DS

Identifier	Vendor	Description
14001	RESON	HydroSweep 3 MD50
14002	RESON	HydroSweep 3 MD30
14003- 14049	RESON	Reserved for HydroSweep 3
14050- 14099	RESON	Reserved

NOTE

From DFD version 2.32 and higher has the T20-P a unique device identifier.

APPENDIX C PROJECTION IDENTIFIERS

The following table defines the reserved values for the custom identifier field of the Geodesy record (record number 1011). Definitions of projection-specific parameters are TBD.

Table 203: Projection Identifiers

Custom Identifier	Projection
-1	Not used
0	Universal Transverse Mercator (UTM)
1	Albers Equal-Area Conic
2	Azimuthal Equal Area
3	Azimuthal Equidistant
4	Bonne
5	Cassini
6	Double Stereographic
7	Equal-Area Cylindrical
8	Equidistant Conic
9	Equidistant Cylindrical
10	European Stereographic
11	Gnomic
12	Oblique Mercator (Rectified Skew Orthomorphic – with skew angle parameter)

APPENDIX D 7K ERROR CODES

Code	Description
0x7000 (28672)	SYSTEM_NOT_READY 7kSystem is not ready for task requested
0x7001 (28673)	PARAMETER_OUT_OF_RANGE Data for this function is not within range specification for this sonar
0x7002 (28674)	RECORD_NOT_AVAILABLE Requested record does not exist. Invalid record number.
0x7003 (28675)	MEMORY_ALLOCATION_ERROR Required memory allocation for task failed
0x7004 (28676)	FIRMWARE_NOT_AVAILABLE Failure with AlphaData/Prpmc. Software not loaded, failed, or hardware failed.
0x7005 (28677)	EXTERNAL_RECORD_NOT_AVAILABLE 1000 series records must be received from external source
0x7006 (28678)	FEATURE_NOT_AVAILABLE Option not available or under development
0x7007 (28679)	REMOTE_COMMAND_NOT_FOUND Not a valid command, i.e. an invalid 7500 ticket like 1483
0x7008 (28680)	INVALID_PARAMETER Data not within DFD specifications
0x7009 (28681)	INVALID_DEVICE_ID Invalid device identifier
0x700A (28682)	RECORD_IS_SUBSCRIPTION_ONLY Record is only available through subscription
0x700B (28683)	PARAMETER_VALUE_CLIPPED Value passed has been clipped to stay within allowed range
0x700C (28684)	REMOTE_COMMAND_DENIED Valid command issued either under invalid condition or with insufficient permissions
0x700D (28685)	REMOTE_BROADCAST_DENIED Remote command cannot be broadcasted to multiple systems
0x700E (28686)	REMOTE_ILLEGAL_BROADCAST Broadcast notation is used with system identifier either zero or 7000
0x700F (28687)	REMOTE_BROADCAST_NO_SYSTEM Some or all enumerators in broadcast notation are not valid systems

Code	Description
0x704F (28751)	REMOTE_BROADCAST_FAILED While using RC Broadcast, several systems nacked with different error codes
0x7050 (28752)	NETWORK_PROTOCOL_VERSION Invalid network protocol version
0x7051 (28753)	NETWORK_OFFSET Invalid network offset
0x7052 (28754)	DATA_PROTOCOL_VERSION Record frame protocol version not valid
0x7053 (28755)	DATA_SYNC_PATTERN Record frame sync pattern not valid
0x7054 (28756)	DATA_CHECKSUM Checksum invalid. Data or checksum corrupted.
0x7055 (28757)	SYSTEM_EVENT_NOT_LOGGED Last system event did not get logged
0x7101 (28929)	RDR_BUSY RDR system is already recording or in playback
0x7102 (28930)	RDR_STOPPED RDR is already stopped
0x7103 (28931)	RDR_MEMORY_ALLOCATION_ERROR RDR memory allocation failed
0x7104 (28932)	RDR_BUFFER_NULL RDR allocated a null buffer
0x7105 (28933)	RDR_BUFFER_TOO_SMALL RDR buffer size is smaller than that needed
0x7106 (28934)	RDR_NO_FILENAME File name given to RDR is invalid or no longer exists
0x7107 (28935)	RDR_INVALID_PARAMETER Parameter passed to RDR is not valid
0x7108 (28936)	RDR_BAD_RECORDFRAME RDR data frame header not valid or corrupted
0x7109 (28937)	RDR_BAD_CHECKSUM RDR checksum invalid. Data or checksum corrupted.
0x710A (28938)	RDR_BAD_EOF End of file not reached
0x710B (28939)	RDR_FILE_CREATION_FAILED RDR failed to create new file
0x710C (28940)	RDR_FILE_OPEN_FAILED RDR unable to open requested file

Code	Description
0x710D (28941)	RDR_FILE_WRITE_ERROR RDR unable to write to file
0x710E (28942)	RDR_FILE_READ_ERROR RDR unable to read file
0x710F (28943)	RDR_FILE_DELETE_ERROR RDR unable to delete file
0x7110 (28944)	RDR_LOCK_FAILED System could not lock file for recording/playback
0x7111 (28945)	RDR FAILURE RDR system stopped, thus and future RDR related remote control commands will be rejected
0x7999 (31129)	UNKNOWN_ERROR An unknown error has occurred

APPENDIX E EXAMPLE C++ SOURCE CODE

This appendix contains an example of C++ source code for interfacing with the 7k sonar source using the TCP/IP protocol. The below extract is from the example ZIP file delivered with this document.

```
// File: Example7k.cpp

#include "stdafx.h"
#include "Example7k.h"

#include <cstdio>
#include <cstdlib>
#include <cstring>

namespace
{
    const char NAME_START[] = "<Name";
    const char DEVID_START[] = "deviceid=\"";
    const char ENUM_START[] = "enumerator=\"";
}

#pragma pack(push, 1)
struct R7500_1050
{
    R7500 r7500;
    u32 record_type;
};

struct R7500_1051
{
    R7500 r7500;
    u32 record_count;
    u32 record_types[2];
};

#pragma pack(pop)
}

// The example connects to the sonar,
// request the XML configuration record (7001),
// subscribes to the raw detections record (7027) and image data (7011),
// and prints out the last detection and center pixel of each ping

void Example7k::Run(const char* host)
{
    if (!ConnectToCenter(host))
        return;

    RequestConfig();
    ReceiveLoop();
}
```

```

```

APPENDIX F HANDLING THE 7027 RECORD

USING THE 7K RAW DETECTION DATA

Refer to the 7027 record definition on page 81.

From sample number to range

The detection point is given as a sample number. Divide this value by the sampling rate to get the two way travel time from the sonar to the detection point. Use the applied soundvelocity for this ping (Record 7000 contains the sonar parameters) or a sv profile to convert the two way travel time to a range.

RX angle

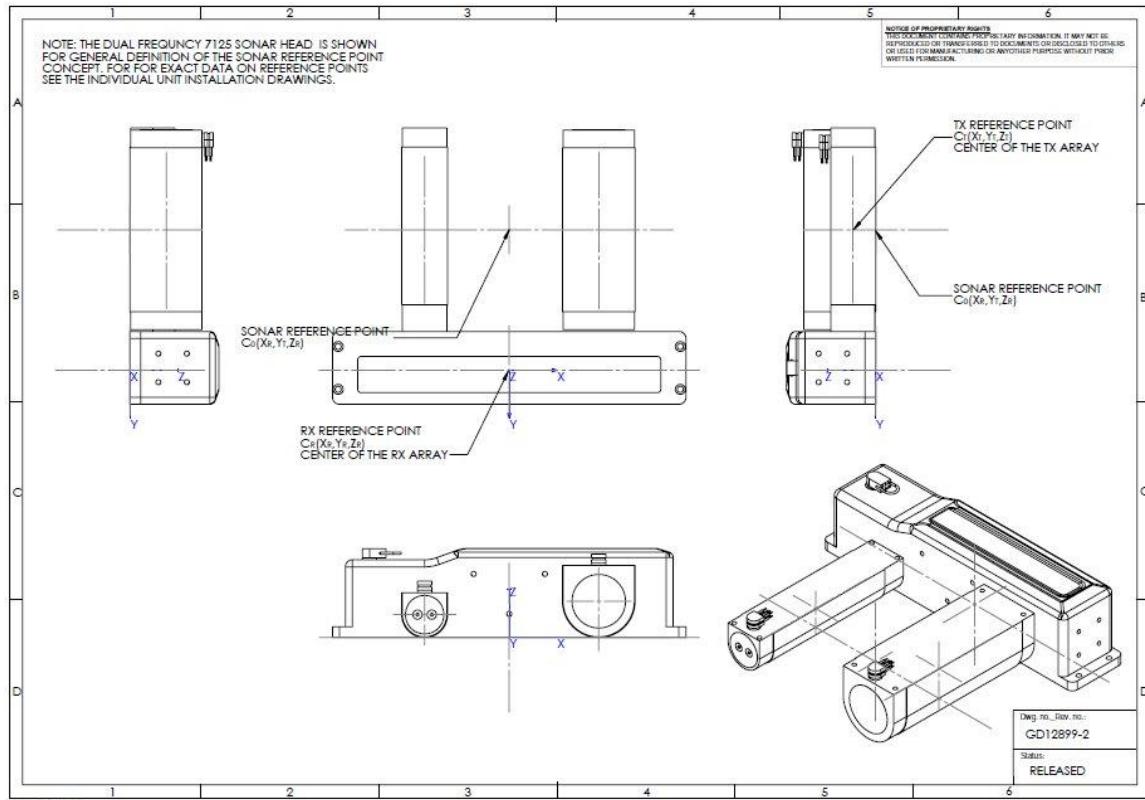

The receive steering angles are in the sonar reference frame and in that frame they represent the actual angle from the sonar reference point to the detection point. The steering applied for roll stabilization is included in the angle. This means that data processing software can use their 'standard' methods to convert the information to the vessel reference frame and subsequently to world coordinates. With standard methods referring to the handling of other RESON SeaBat systems outputting non roll stabilized data.

Beam uncertainty

This value is a real-time uncertainty and available per beam. These values can be used to feed into an error model instead of the a-priori error values typically used to compute a TPE. Will be available in MR7.2 release.

TX OFFSET CORRECTION

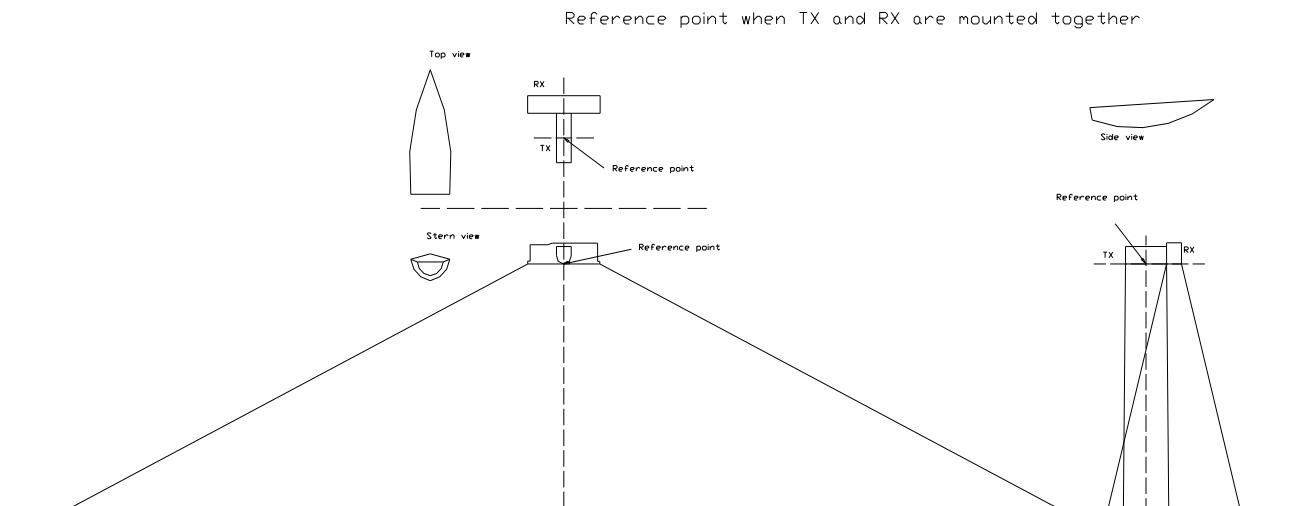

The sonar reference point is used to define the coordinate system to which sonar data is referred. The Sonar Reference Point X&Z coordinates are the same as the X&Z coordinates of the sonar receiver head reference point. The Y coordinate of the reference point is the same as the Y coordinate of the Tx array reference point. Thus the coordinates of the reference point of the sonar are C0(XR,YT,ZR).

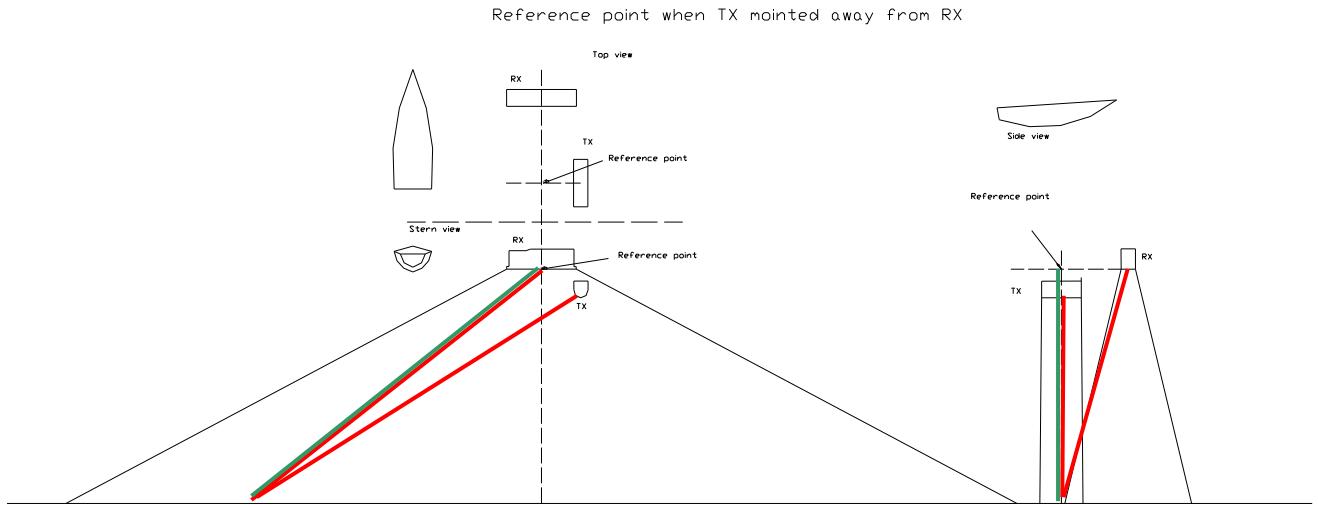

The Tx offset is defined as the separation of the projector (Tx) reference point from the receiver (Rx) reference point.

The Tx offset information is available from the sonar in a separate record (7503)

The along ship reference point (Y) of the sonar is determined by the Transmitter since this one illuminated the seafloor at the moment of the ping with a narrow across stripe of sound. The across (X) and height (Z) reference point is determined by the receiver because this one forms the narrow beam in a predetermined direction.

When we have a transducer configuration with separation between the RX and TX (bi-static configuration) we need to adjust the observed two-way travel time to the sonar reference point.

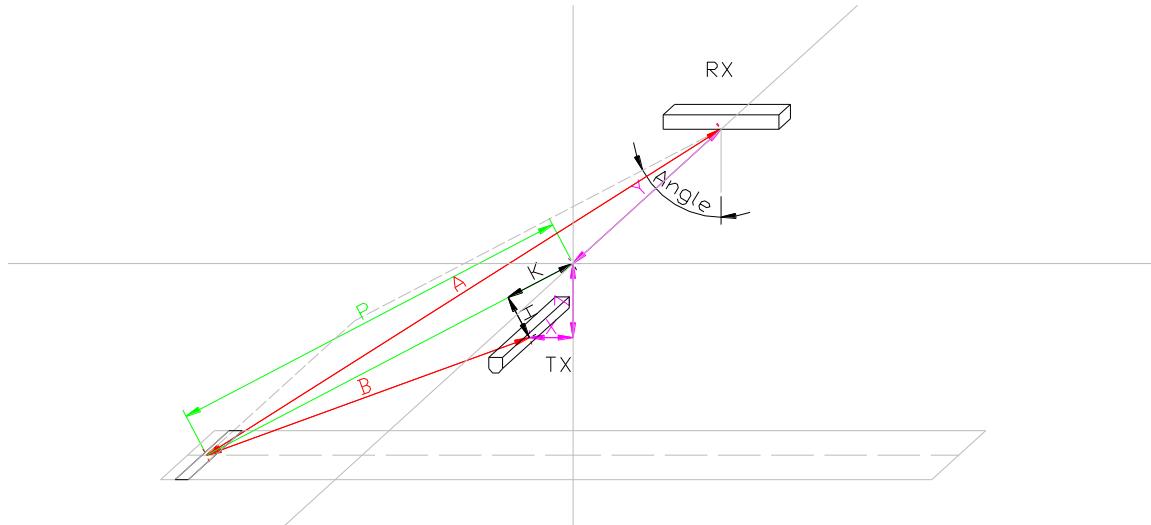

Red line: acoustic path of observation.

Green line: Reported two-way travel and beams angle relative reference point.

In the Teledyne PDS software the implementation of the Tx-offset correction is according the steps below.

- The Tx offset value is converted from sonar reference frame to vessel reference frame. Heave at transmit time is added.
- An Rx offset point in vessel reference frame is created using heave at receive time.
- From these two offset points a vector is created and split in a component in beam direction and a component perpendicular to the beam direction.
- An iteration method is used to compute a correction factor that is applied to the beam range (and two travel time).
- The iteration is illustrated in the diagram below

The algorithm description is based on range, and not two-way travel time.

Variable name	Description
X	X Offset of TX relative RX, positive when TX starboard of RX
Y	Y Offset of TX relative RX, positive when TX forward of RX
Z	Z Offset of TX relative RX, positive when TX above RX
Angle	Measured beam angle = $180 - 7K$ beam angle
R	Observed range $(A+B)/2$
A	RX to detection point
B	TX to detection point
K	Longitudinal offset of TX in beam direction relative ref.
H	Perpendicular offset of TX to beam
P	Corrected range

We want to compute the corrected range (P)

$$H = X \cdot \cos(\text{angle}) + Z \cdot \sin(\text{angle})$$

$$K = X \cdot \sin(\text{angle}) - Z \cdot \cos(\text{angle})$$

$$\sqrt{(P^2 + Y^2)} + \sqrt{((P-K)^2 + H^2)} - 2 \cdot R = 0$$

Since there is no direct solution to this equation we solve it with iteration.

The iteration will be started with best estimate

$$R = \text{two-way travel time} * \text{Speed of sound} / 2;$$

$$P=R$$

Only do the iteration when $\sqrt{(X^2+Y^2+Z^2)} < P$

$$D=0$$

Do

{

$$P = P - D/2$$

```
D = √(P2 + Y2) + √((P-K)2 + H2) - 2*R  
}  
While( |D| > 0.005)  
Hereafter P will be the corrected range.  
Corrected Two-way travel = P*2 / Speed of sound;
```

USING THE OPTIONAL DATA FROM 7027

The Optional data section of 7027 is the same as the optional data section of the 7006 record. The only difference being is that now only the valid beams are given.

The optional data is used in the CARIS version in use by Ifremer

The optional data is fully corrected for motion, sound velocity and Tx-offset. No additional corrections need to be applied to this data.

USING THE ‘OLD’ RECORDS WITH MR7

With the MR7 there is backwards compatibility for the 7006 bathymetry record. Third party software processing working according to SeaBat 7k DFD Version 0.54 will still be able to obtain that record.

Please be aware of the following:

- In case of roll stabilization it is not possible then to obtain the beam steering angles in the sonar reference frame. So the processing software should not perform a roll correction in that case. In situations where there is a sonar-IMU alignment error it will not be possible then to compensate for pitch induced roll.
- The Tx-offset correction also requires the beam steering angle in the sonar reference frame. The closest approximation in this situation is to apply the actual roll value to the beam angle based on the assumption that the sonar and the processing software work with the same roll values.

APPENDIX G WAKE ON LAN (WOL)

With wake on LAN (WOL), it is possible to switch on a remote computer by means of a special network package transmitted over a LAN network connection (not wireless). This package is known as 'magic packet'.

The magic package consists of 102 bytes. It starts with 6 bytes of HEX 255 (FF FF FF FF FF FF) followed by 16 times the 48-bit MAC address of the remote computer.

The magic packet must be broadcasted.

The remote computer can be switched off; however, the network card should be 'alive' in order to wake up the computer.

Refer to external sources for more information about WOL such as Wikipedia.
[\(http://en.wikipedia.org/wiki/Wake-on-LAN\)](http://en.wikipedia.org/wiki/Wake-on-LAN)

APPENDIX H DATA TRANSFORMATIONS (BLUEVIEW)

The Pan/Tilt base coordinate system, is the system that is used to report pan and tilt angles in record 5836. It is standardized on a right-handed coordinate system with a well-defined origin for this streaming spec. and for the pan/tilt SDK going forward.

Beam angles and detection ranges reported in the Multibeam Configuration record (7004) and the Bathymetric record (7006), respectively, are reported with respect to a two-dimensional polar axis system (i.e., R-Theta) fixed to the sonar head acoustic center. This axis system moves in space based on pan and tilt angle, vessel/tripod position and motion, sonar mounting configuration, and pan/tilt unit mounting configuration. The orientation contained in the PanTilt Configuration record and PanTilt Position record provides sufficient information to compute a function that maps a detection (beam angle and range) to a 3-dimensional point in an axis system fixed to the base of the pan/tilt unit. Once the transform function is produced, each detection may be mapped by a simple substitution of the detection's range and bearing into the function.

This section describes how to populate the function coefficients and arguments based on the values in the Pan/Tilt Configuration record and Pan/Tilt Position record. Note that the PanTilt Configuration record data entries are static throughout an entire scan, while the PanTilt Position record entries generally change per ping.

The following diagrams show the unit's base coordinate system and definition of lever arm offsets. In Figure 13-1, the sonar is oriented such that the Pan and Tilt positions would each be reported as 0° in the Pan/Tilt Position record

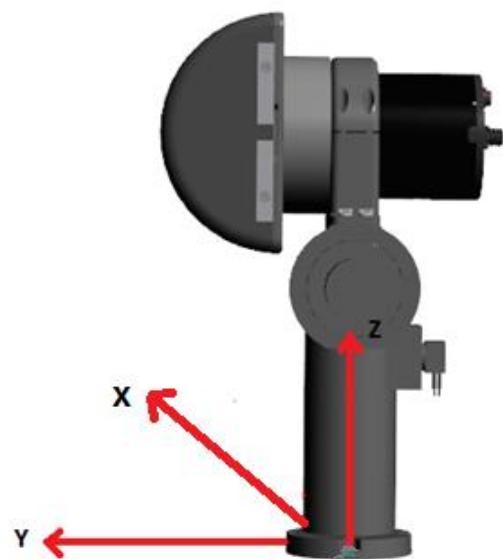

Figure 13-1: Pan/Tilt Unit Axes

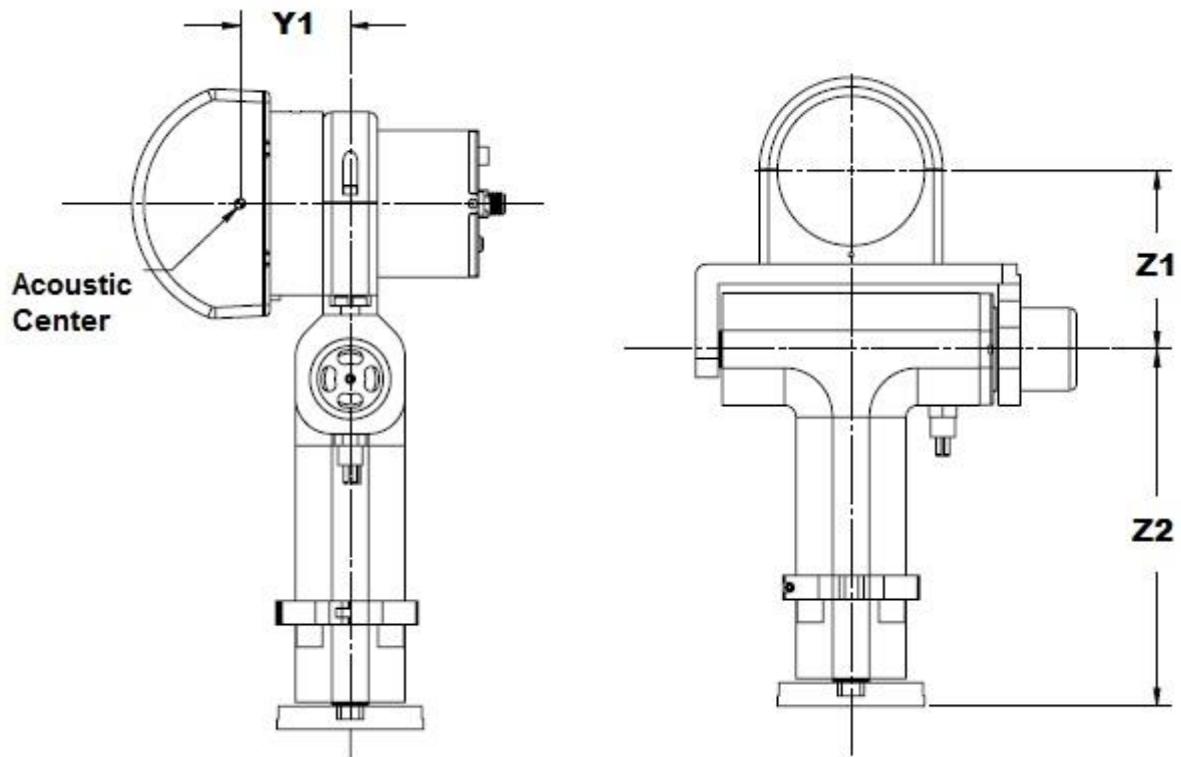

Figure 13-2: Pan/Tilt Offsets

NOTATION AND CONVENTIONS

The following table provides the notation and record data field names for all symbols in the output vector described below. All rotational axes have right-handed sign conventions with respect to the corresponding Pan/Tilt Base coordinate axes.

Table 204: Parameter Notation

Symbol	Description	Record ID	Record Field Name	Static/Dynamic over course of scan
$c(\cdot)$	cosine	N/A	N/A	N/A
$s(\cdot)$	sine	N/A	N/A	N/A
ϕ	Sonar head roll angle (typically 0° or 180°),	5835	Head Roll Orientation	Static
ψ_p	Pan angle	5836	Pan Position	Dynamic
ψ_t	Tilt angle	5836	Tilt Position	Dynamic
z_1	Length of tilt axis lever arm (see Figure 13-2)	5835	Tilt Elbow Offset	Static
z_2	Length from pan/tilt base to tilt axis (see Figure 13-2)	5835	Tilt Axis Offset	Static
y_1	Length of pan axis lever arm (see Figure 13-2)	5835	Pan Arm Offset	Static
r_i	Range to detection for beam i	7006	Range[i]	Dynamic
θ_i	Bearing to detection for beam i	7004	Beam Bearing Angle[i]	Static

DETECTION TRANSFORMATION EQUATION

The following equation provides a detection point in pan/tilt XYZ coordinates based on the static and dynamic geometric parameters provided in Table 204. The XYZ coordinate system is shown in Figure 13-1.

$$\begin{bmatrix} x_i \\ y_i \\ z_i \end{bmatrix} = \begin{bmatrix} c(\psi_t)s(\psi_p)(-r_i c(\theta_i) - y_1) + z_1 s(\psi_p)s(\psi_t) - r_i s(\theta_i)(s(\phi)s(\psi_p)s(\psi_t) - s(\phi)c(\psi_p)) \\ c(\psi_t)c(\psi_p)(r_i c(\theta_i) + y_1) - z_1 c(\psi_p)s(\psi_t) - r_i s(\theta_i)(c(\phi)c(\psi_p)s(\psi_t) - s(\phi)s(\psi_p)) \\ r_i(c(\theta_i)s(\psi_t) - c(\psi_t)c(\phi)s(\theta_i)) + z_1 c(\psi_t) + y_1 s(\psi_t) + z_2 \end{bmatrix}$$

Derivation details for the equation above are provided in the whitepaper *BlueView Pan/Tilt Kinematics*, which is available upon request.

COMPUTATIONAL EFFICIENCY

The vector equation above must be computed once for each detection in each ping, which quickly becomes a computational burden for systems with high ping rates and/or many detections per ping. Some simple optimizations can help computational efficiency to great effect. It is suggested that trigonometric functions of dynamic values are computed just once per sonar ping and cached as local variables since they each arise multiple times in the vector function. Similarly, multiplicative combinations appearing in many of the terms can be precomputed per ping for computational efficiency. Of course, the equation is executed in a loop over the entire set of detection ranges for a given ping, so it is a prime candidate for vectorization operations via a single-instruction-multiple-data (SIMD) coprocessor or similar parallelizing processor (e.g., GPU acceleration). Some combination of these types of optimization should allow real-time conversion capabilities on any modern hardware.

GEOREFERENCING DATA

Note that the transformation provided in the previous section places a detection point in a coordinate system fixed to the base of the pan/tilt unit. To georeference the detections, further transformation(s) are required, which take account of additional static and dynamic offsets, such as pan/tilt unit base axis offsets in the vessel coordinate system, vessel dynamic position, flexible mount points, etc. These additional transformations and any associated parameters are not provided by ProScan's network interface and are the responsibility of client applications.

APPENDIX I 7042 COMPRESSED WATER COLUMN DATA

This Appendix describes the compression algorithms used to fill the 7042 – Compressed Water Column Data message.

The appendix is primarily written to support Sonar software developers in filling the 7042 message from a full set of Water Column sample data.

All fields described in this document refer to the fields defined in the 7042 message.

Currently the 7042 can store Magnitude and Phase values.

USE MAXIMUM BOTTOM DETECTION POINT LIMIT

When the *Use maximum bottom detection point limit* bit is set in the *Flags* field, the bottom detection points are used to limit the Water Column samples to create a subset of samples.

For each beam of Water Column samples, data is included up to the bottom detection point + 10%.

DOWN SAMPLING

One of the following down sampling methods can be selected using bits in the *Flags* field:

1. No down sampling.
2. Middle value down sampling.
3. Peak value down sampling.
4. Average value down sampling.

A down sampling divisor value can be stored in some bits of the *Flags* field. When the down sampling divisor is zero a down sampling divisor of 1 is assumed; meaning no down sampling was applied. The maximum down sampling divisor value is 15.

When down sampling was applied the samples provided in the 7042 message are a subset of the original set of water column samples. For each group of consecutive “down sampling divisor” samples one combined sample value is computed; middle, peak or average value depending on the selected down sampling method.

This computed value is optionally compressed before it is stored in the 7042 message. Compression of data is described below.

Notes:

- The selection No down sampling is equal to Middle value down sampling with a down sampling divisor value of 1.
- For Middle value based down sampling it is best to select an odd valued down sampling divisor.
- Peak value down sampling uses the Magnitude of a sample to select a sample for output.
- Down sampling is applied after using maximum bottom detection point limit.

COMPRESSION

The following compression methods can be selected using bits in the Flags field:

1. Include Magnitude data only, strip Phase data.
2. Convert 16 bit values to 8 bit values.
3. Convert 32 bit magnitude values to 8 bit values.

Method 1 does not need further explanation, the Phase data is simply not stored in the record.

Method 2 conversion from 16 bit values to 8 bit values is handled differently for Magnitude and Phase; both methods will be described below.

Method 3 conversion from 32 bit magnitudes to 8 bit values is described below and only affects magnitude when 32 bits data needs to be reconstructed.

Phase Compression:

Phase compression simply truncates the lower (least significant) byte of the Phase value. Assume downSampledPhase is a WORD containing the Phase.

BYTE compressedPhase = (BYTE) (downSampledPhase >> 8)

16 Bit Magnitude Compression:

Convert Magnitude to dB and store as a 8 bit value. Assume downSampledMagnitude is a WORD containing the 16 Bit Magnitude value.

BYTE compressedMagnitude = (BYTE) floor(factor * log10(downSampledMagnitude) + 0.5)

When Bit 13 in the Flags field is set, factor must be taken from the *Compression factor* field of the 7042 record. When Bit 13 is not set a value of 40.0 is used.

32 Bit Magnitude Compression:

Convert Magnitude to dB and store as a 8 bit value. Assume downSampledMagnitude is a DWORD containing the 32 Bit Magnitude value.

BYTE compressedMagnitude = (BYTE) floor(factor * log10(downSampledMagnitude) + 0.5)

When Bit 13 in the Flags field is set, factor must be taken from the *Compression factor* field of the 7042 record. When Bit 13 is not set a value of 40.0 is used.

Notes:

- Compression is applied after down sampling; described above.
- When creating a 7042 record you can set Bit 13 to provide a custom *Compression factor*. When you do not set Bit 13 factor 40 must be used to compress magnitudes.
